THE
CANADIAN YEAR BOOK
1984

PREFACE

This edition of the Canada Year Book covers a period of between 16 and 17 months as compared with the normal span of 12 months. The reason for this goes back to circumstances existing during the war years. It was difficult at that time for non-war Departments of Government to maintain printing schedules, due to the pressure brought to bear on the facilities of the Government Printing Bureau by war Departments which, of course, had priority. Thus, during the six years of war there was a steady and cumulative lag in the publication of the Year Book. Planned to appear about mid-year, the situation had become such that the 1946 edition was not available for distribution until early in December, 1946, and the 1947 edition was published on the eve of 1948.

In order to place the current edition back on a normal schedule, it was decided to make this a 1948-49 edition and plan for its completion and distribution about April or May, 1949. There is every reason to feel that such a mid-year schedule can be maintained for future editions.

The 1947 Year Book covered a period when the difficulties of transition from war to peace were still to the forefront. During the War and subsequently all available space was required for detailed treatment of the war effort and the reconstruction program and, during these years, Year Books carried practically no contributions dealing with normal scientific and other civilian services such as usually appear in the Chapters on Physiography, Population, Vital Statistics, Education, Constitution and Government, etc. The period covered by the present volume has been marked by a very definite swing to a more normal peacetime economy and such space as could be released in the current edition has been given to special articles designed to catch up with the accumulation of these important regular subjects. The established Year Book program calls for the revision at five-year intervals of such regular basic articles unless, from their nature, sufficient change has not taken place. In the Chapter on Physiography a new Part on Geophysics which treats of the research work carried on by the Dominion Observatory in the fields of Gravity and Terrestrial Magnetism—directions in which scientific research is playing an important part to-day—appears at pp. 18 to 27. In the same Chapter a special article on the contribution to science made by the Dominion Astrophysical Observatory, at Victoria, B.C., is included (pp. 63 to 71), and an extended review of the Climate of Canada appears at pp. 41 to 62. The subject of climate has not been reviewed in the Canada Year Book since the 1929 edition. In the meantime, the science of meteorology has been developed substantially as aviation has advanced and the demand for more precise data on air movements, aviation ceilings and visibilities has increased. To complete this treatment of climate it is planned to carry a series of long-term climatic tables for stations of Eastern and Western Canada in the following two issues of the Year Book. The present Chapter on Physiography also carries an article on Canada's Western Arctic which, with the one on the Eastern Arctic published in the 1945 edition of the Year Book, provides an up-to-date review of those vast areas of Canada north of the provincial boundaries.

Other special material in this edition treats of the formal educational field in Canada (pp. 309 to 313); of the growth of the chemical industries during the past decade (pp. 532 to 550) and the administration of Indian affairs receives attention at pp. 1170-1177.

The policy of reprinting important special material from the Year Book, authority for which was obtained in 1945, has proved increasingly popular especially with university students and schools of higher education. Many thousands of copies of these reprints are sold each year. Unfortunately, the number of such reprints that it is possible to make, without delaying the printing of the Year Book itself, is limited. A list of reprints at present available is given at p. xiii.

The program of improving and bringing up to date the regular chapter material has been continued. Suggestions to this end are constantly being received from many sources and are given careful consideration. Chapter III—Constitution and Government—has been reorganized and new material on the Judiciary introduced. Public Health and Welfare Services are now combined under one chapter heading. A beginning has been made in the Domestic Trade Chapter (see pp. 801 to 812) in building up an over-all picture of warehousing facilities and storage stocks. Special compilations made during the war years and required for the war effort have provided the basis for this work but the presentation is by no means complete and will be developed in future editions. National Accounts, which are in essence economic rather than financial in nature since they summarize the more important economic transactions and co-ordinate the Canadian economy as a whole, have been removed from their former place in the Public Finance Chapter and will now be found combined with the Survey of Production, International Investments, Corporation Profits and other related statistics.

The record of Foreign Trade—Chapter XXI—bears a very important relationship to the Canadian economy, since national prosperity depends vitally on our export position. In foreign trade matters Canada is now passing through a most critical transition phase as outlined in this Chapter and in the Introduction. Certain old established markets, channels for which have been cut deep by time, have been unable since the War to take Canadian goods in former quantities and a pronounced shift in export trade is taking place.

Chapter XXII—Prices—opens up with a treatment (continued from earlier editions) of the Activities of the Wartime Prices and Trade Board during 1947 and 1948, a period of adjustment and price decontrol (pp. 945-950). After November, 1947, events halted the decontrol program and led to the reimposition of price controls on certain items. This and immediately preceding issues of the Year Book give a very complete summary of the operations of the Board.

Due to the establishment of Government records and the drafting of specific programs for reconstruction and other national projects (see Chapters XVIII, XXI, XXVII, and the Introduction) action in the general interest of the nation can now be brought to bear in several directions, should the need arise for modifying any temporary set-back in the economic picture. The Unemployment Insurance Fund (see pp. 644 to 645) has reached substantial proportions and may be regarded as one of the most liquid reserves against recession. Social Security and Welfare Benefits including Family Allowances (Chapter VII and Chapter XVIII) are also well established as a buffer to absorb any shock of this nature.

This Year Book contains more than the usual number of inserts in the form of lithographed and black-and-white maps. It is considered that these add appreciably to the interpretation of the text.

The present volume has been edited by A. E. Millward, Director, Canada Year Book Division, assisted by Herbert H. Coulson and the Year Book Staff. Charts, graphs and layouts have been made by or under the direction of J. W. Delisle, Senior Draughtsman of the Bureau.

Acknowledgments are hereby tendered to the numerous officials of the Federal and Provincial Governments, and to others who have contributed material. Whenever possible, credit is given to the persons and various services concerned by means of footnotes to the respective sections.

With a view to the improvement of future editions, the Bureau will be glad to hear of any errors that may have escaped notice and to receive suggestions with regard to omissions or to methods of treatment.

HERBERT MARSHALL,
Dominion Statistician.

DISTANCES BETWEEN PRINCIPAL POINTS IN CANADA.*

NOTE.—Generally, the distances given are the shortest by railway.

A knowledge of distances in miles between principal points constitutes very useful information in these days of wide travel, but when an attempt is made to compile such data difficulties are at once encountered.

By rail, distances are the logical choice, even though road distances are of increasing interest to a vast body of travellers by automobile and are a useful alternative. Railway distances represent usually the shortest practicable land distances between two points and even to-day the bulk of freight and passenger traffic is by rail. Again, distances by air (sometimes called "bee-line" distances) are only useful in practice to those who travel by air. This is a growing phase of transportation, of course, but has not yet assumed such proportions that its tabulation should displace the more usual one. Again, it is not a difficult matter to estimate air-line distances from a map made to convenient scale, whereas the ordinary reader is not able to obtain railway distances easily.

Even though it be decided to adopt railway distances as most useful, it is necessary to decide whether the most travelled route between two places or the shortest railway route should govern. In the tables given below, the distances between points are the shortest distances by railway and not necessarily the most travelled routes or the routes by which main trains travel. They are compiled principally from the railway time tables. The main table includes the capital of each province and some of the main shipping points chosen principally, but not altogether, by population; the subsidiary tables include distances of local importance. Included in the distances from Charlottetown is the distance from Borden to Cape Tormentine, over which the trains are transported by ferry; similarly, the train ferry distance between Mulgrave and Point Tupper is included in the distance from Halifax to Sydney. In the main table all the distances from Victoria include the distance travelled by boat from Victoria to Vancouver. However, wherever possible, railway distances only are used. In certain distances from Three Rivers and from Quebec it is possible, by the use of ferries, to travel by shorter routes than those given in the tables, the rail route only being taken in these cases.

Where boat routes are given, the best approximation of the distance travelled is used.

The air-line distances are not necessarily the straight-line distances between points, but are the distances over the routes usually travelled by aeroplanes in good weather.

ARTICLES AND MISCELLANEOUS TEXT MATERIAL (PUBLISHED IN FORMER EDITIONS) CLASSIFIED BY SUBJECT

NOTE.—It is not possible to include in any single edition of the Year Book all articles and descriptive text of previous editions, and the following list has been compiled as an index to such miscellaneous material and special articles as are not repeated in the present edition. This list links up the 1948-49 Year Book with its predecessors in respect to matters that have not been subject to wide change. Those sections of chapters, such as Population, which are automatically revived when new material is made available from a later census and to which adequate references are made in the text, are not listed unless they are in the nature of special contributions. The latest published article on each subject is shown, except when an earlier article includes material not repeated in the later one. When articles cover more than one subject they are listed under each appropriate heading.

WEIGHTS AND MEASURES AND OTHER INTERPRETATIVE DATA

In Canada, as a rule, the imperial system of weights and measures is followed. An exception, however, is the ton where, unless otherwise stated, the short ton of 2,000 lb. is meant.

The following table shows the weights and measures used in Canada in connection with the principal field crops and for wheat flour and fruits:—

Grains—	<i>Pounds per Bushel</i>	Fruits (standard conversions)—	<i>Pounds</i>
Wheat.....	60	Apples, per barrel.....	135
Oats.....	34	Apples, per box.....	43
Barley.....	48	Pears, per bushel.....	50
Rye.....	56	Plums “ “.....	50
Buckwheat.....	48	Cherries “ “.....	50
Flaxseed.....	56	Peaches “ “.....	50
Corn.....	56	Grapes “ “.....	50
Mixed grains.....	50	Pears, per box.....	42
All others.....	60	Strawberries, per quart.....	1·25
Wheat Flour—		Raspberries “ “.....	1·25
1 barrel equals 196 pounds and approximately 4·5 bushels of wheat are used in the production of a barrel of flour.		Loganberries “ “.....	1·25

Relative Weights and Measures, Imperial and United States

The following tables of coefficients may be used to translate amounts expressed in one unit to the other or vice versa.

1 Imperial pint=20 fluid ounces.	1 Imperial proof gallon=1·36 United States proof gallon.
1 United States pint=16 fluid ounces.	1 short ton=2,000 pounds.
1 Imperial quart=40 fluid ounces.	1 long ton=2,240 pounds.
1 United States quart=32 fluid ounces.	1 barrel crude petroleum=35 Imperial gallons.
1 Imperial gallon=160 fluid ounces.	
1 United States gallon=128 fluid ounces.	

FISCAL YEARS OF DOMINION AND PROVINCES

The Federal Government fiscal year ends on Mar. 31.

The dates on which the fiscal years of the provinces end are as follows:—

Prince Edward Island.....	Mar. 31	Manitoba.....	Mar. 31
Nova Scotia.....	Nov. 30	Saskatchewan.....	Mar. 31
New Brunswick.....	Oct. 31	Alberta.....	Mar. 31
Quebec.....	Mar. 31	British Columbia.....	Mar. 31
Ontario.....	Mar. 31		

Throughout the Year Book, fiscal-year figures are so indicated in the text and headings of tables; in all other cases figures are for calendar years.

STATISTICAL SUMMARY OF THE PROGRESS OF CANADA, 1871-1947

NOTE.—In the following summary, the statistics of fisheries (1871-1911), trade, shipping, the Post Office, the public debt, revenue and expenditure, and the Post Office and Government savings banks relate to the fiscal years ended June 30 up to 1906; subsequently to years ended Mar. 31, except in the case of trade, where, as indicated by footnotes, calendar-year figures are given for certain later years. Agricultural, dairying, fisheries (from 1931), mineral, manufacturing, banking, insurance, loan and trust companies, construction, road transportation, vital, hospital, and immigration statistics relate to the calendar years, and railway statistics to the years ended June 30, 1871-1911, and to the calendar years 1921-46. Canal statistics are those of the navigation seasons. Telegraph statistics relate to the fiscal years for Government lines and to the calendar years for other lines.

STATISTICAL SUMMARY OF THE PROGRESS OF CANADA

Area of the Dominion of Canada in square miles: Land, 3,462,103; Fresh Water, 228,307; Total, 3,690,410.

NOTE.—Dashes in this table indicate that comparable data are not available for the years so indicated.

and cheese; quantities have been calculated by reckoning cheese at 10 cents per lb. and butter at 25 cents per lb.

² Data shown for 1945-1947 represent cheddar and other cheese made from whole milk; prior to 1942 the figures include other cheese for Quebec only.

¹⁰ Fiscal years prior to 1931.

⁹ Prior to 1921 this item does not include skim milk and buttermilk.

hand trades, repair and custom work. Figures for 1931-46, include non-ferrous metal smelting not included in earlier years.

¹² Since 1924 the net value of production is computed by subtracting the cost of fuel and electricity as well as the cost of materials from the gross value of the products.

¹⁵ Duplication eliminated.

¹⁶ Fiscal years.

¹⁷ 1876.

¹⁸ 1875.

¹ Figures are subject to revision.² Fiscal year figures prior to 1941.³ In foreign service, which

includes sea-going and inland international after 1936.

⁴ Prior to 1941

Temiskaming and Northern Ontario

Railway Commission was not included.

⁵ As at June 30.⁶ Excludes rural lines in Saskatchewan.⁷ Census figures for calendar years, 1930 and 1941, respectively.⁸ Estimated on basis of intercensal survey.

Insurance took over the administration of the legislation concerning loan companies, the figures are not comparable. They are shown, however, at pp. xi and xli of the 1938 Year Book. ¹⁰ Compiled from data supplied voluntarily to the Superintendent of Insurance by provincial companies but estimated to cover about 90 p.c. of all provincial business. The figures include all the large and most of the small provincial companies. ¹¹ Not including fraternal insurance.

INTRODUCTION *

The war and post-war economic efforts were of such magnitude that in less than a decade the Canadian economy became highly industrial. The consolidation of this changed position in the post-war era has meant the full revival of a peacetime economy but on other than the pre-war economic patterns. Far-reaching adjustments have still to be made that will take account of Canada's economic progress during the war years, the deterioration in the economic position of Europe, and the greater importance of the United States as a determinant in levels of world trade, a competitor, and a market. All Canadian industries are necessarily participants in the process of economic adjustment and readjustment. They are assisted by governmental action, both federal and provincial, particularly wherever appropriate measures are beyond the scope of private firms and individuals. It is proposed in this Introduction to review in a general and topical way changes in the Canadian economy since 1939, and Federal Government measures during and after the War that were associated with those changes. A more specific discussion of Federal and Provincial Government activities in connection with post-war reconstruction is to be found in Chapter XXVII.

That adjustments would have to be made to bring the Canadian economy into line with post-war conditions was recognized by the Federal Government before hostilities ended, and the implications—translated into policy terms—were outlined in April, 1945, in the White Paper on *Employment and Income* (summarized in the Canada Year Book, 1945, pp. 843-847). The Government, in that Paper, stated “unequivocally its adoption of a high and stable level of employment and income, and thereby higher standards of living, as a major aim of Government policy”, and pointed out that “if it is to be achieved, the endeavour to achieve it must pervade all Government economic policy” and “must be wholeheartedly accepted by all economic groups and organizations as a great national objective, transcending in importance all sectional and group interests”.

The economic and industrial developments of the post-war period, apart from those of a definite reconstruction nature, and the role of the Federal Government in helping to deal with them, can be conveniently considered under the following headings: (1) Changing Government Functions, (2) Private and Public Investment, (3) Foreign Trade, (4) Special Problems of Industry, (5) the Labour Market and (6) Social Security. Before dealing with these subjects, however, it is advisable to consider briefly the economic conditions under which developments in these fields have been taking place.

Economic Environment of the Post-War Period.—The liquidation of the industrial and military war effort and the expansion of peacetime economic activities to take the place of large-scale government buying of war material were complementary parts of the reconstruction task. Despite innumerable difficulties, both these objectives were attained with little economic dislocation, the result

SIGNIFICANT ECONOMIC FACTORS

1935 - 48

BILLION
DOLLARS

BILLION
DOLLARS

being that both employment and national income were sustained at high levels during the transition period. Unemployment did not exceed 4 p.c. of the working force and dropped to about $1\frac{1}{2}$ p.c. in 1947, close to an irreducible minimum. At the end of 1948 Canada had 5,000,000 people in gainful employment, 700,000 more than the number of civilians gainfully employed in the peak war year of 1943 and 1,300,000 more than in 1939. Gross national product at market prices reached its wartime peak at \$11,887,000,000 in 1944. After a fall of little more than 1 p.c. to \$11,732,000,000 in 1945, it rose to \$11,863,000,000 in 1946, to \$13,375,000,000 in 1947, and is expected to be about \$15,500,000,000 in 1948.

When account is taken of rising prices since the end of hostilities, the *real* improvement in gross national product is, of course, lower than the above figures would indicate; the rise in prices was particularly rapid during 1947. If allowance is made for higher price levels and for net investment, the increase in gross national product since the pre-war period—from \$5,598,000,000 in 1939 to an approximate \$15,500,000,000 in 1948—has meant an average improvement of about 50 p.c. in the living standards of the Canadian people. This improvement resulted primarily from the fuller and more effective utilization of man-power, which in turn brought about the most rapid expansion of production experienced in any period of Canadian history for which records exist. Among the factors that contributed to the maintenance of employment and national income and to strong inflationary pressure in the post-war period were:—

An Increase in Investment in Capital Goods.—Investment in capital goods and housing, excluding outlays made directly by governments, increased from \$865,000,000 in 1945 to an estimated \$2,600,000,000 in 1948. This resulted in a heavy demand for building materials and machinery to equip plants and to erect houses and other buildings. In addition, a heavy accumulation of inventories has taken place. The factors influencing capital outlays were the current need for additional production facilities coupled with a large backlog of replacement needs, favourable market prospects, and availability of investment funds out of savings of the war period, current income, and a money market reasonably favourable to investors.

An Increase in Personal Expenditure on Goods and Services.—From \$6,945,000,000 in 1945, this expenditure rose to an estimated \$9,800,000,000 in 1948, or by more than 40 p.c. A considerable part of the increase, but by no means all, reflected rising prices. An important part of the *real* increase resulted from greater purchases of durable consumer goods such as automobiles and household equipment and furnishings. The purchasing power to make consumer demand effective came from personal savings of the war period and increasing current income from both wage-earning and non-wage-earning employment. During the post-war period, personal income has been supplemented by increased payments from governments to individuals in the form of new social security benefits and certain payments of a non-recurring nature such as veterans' grants and refunding of the compulsory savings portion of the income tax.

The Maintenance of a Large Volume of Exports of Goods and Services.—The bulk of Canadian wartime commodity exports, apart from foodstuffs and certain other unspecialized products, consisted of mass-produced war munitions and equipment no longer in demand after the end of the War. The supplying of post-war export demand involved, therefore, extensive changes in production and, in the circum-

stances, it is remarkable that the annual value of the Canadian exports during the transition period never fell below two-thirds of that of 1944—the peak war year. Purchases in Canada by war-devastated countries have been supported during the post-war period by large export credits extended to them by the Canadian Government and more recently by United States Government financing under the European Recovery Program.

While the above three factors—increased investment, increased consumption expenditure, and the large volume of Canadian exports—have contributed to the demand for goods and services that has ensured high levels of employment and income, the great increase in demand for goods and services since pre-war days has not been an unmixed blessing. It has imposed a heavy additional inflationary pressure on the Canadian economy during a time when it was not fully geared for civilian production. At the same time it contributed to the foreign exchange problem by pushing the level of imports of goods and services from the United States from \$1,200,000,000 in 1945 to \$1,975,000,000 in 1947. A decrease in annual government expenditure on goods and services from \$3,700,000,000 to an estimated \$1,500,000,000 over the same period of time, together with a change from deficit to surplus budgeting, has acted as a restraining influence on inflationary forces, while the gradual easing of general wartime controls with the retention of certain key controls has prevented the full impact of the inflationary pressures from being felt in the economy.

Changing Government Functions

As a result of the adoption of the policy of a high and stable level of employment and income, there have been some changes in the Government's approach to problems of broad economic development and, in certain fields, a more active participation in economic activity than before the War. The implications of such a policy became more clearly defined during the War and in the immediate post-war period. Four main tasks evolved: (1) the need to integrate the Government's efforts to assist in the maintenance of a high and stable level of national income and employment; (2) the need to devise economic units within the Government effective and flexible enough to cope with the changing day-to-day economic problems that have an important bearing on the execution of the first task; (3) the need for an objective appraisal, both in quantitative and qualitative terms, of what is involved in making the most effective use of Canada's resources, both human and material; (4) the need to establish a two-way liaison between the Federal Government and the Provincial Governments, management and labour, and consumers and producers in order to ensure that the effort to maintain a high level of employment and income would be a truly national one.

Policy Formulation.—The growing recognition of the implications of the employment and income policy led to the establishment of the Cabinet Committee on Economic and Industrial Development in May, 1948. This Committee succeeded the Cabinet Committee on Reconstruction established in 1944, but has wider terms of reference. The Committee is to advise the Government on: (1) matters connected with general economic and industrial development; (2) appropriate measures to maintain a high level of employment and income in any region or in Canada as a whole; (3) public investment policy as related to public projects and resources development, including preparation and utilization of a number of reserve projects and use of the special projects vote.

Administrative Agencies.—To help cope with the administrative problems of the post-war period, the Government has made a number of important changes in departmental organization and has used the instrumentality of Crown Companies, boards and other agencies to decentralize certain continuing peacetime functions of government. Among examples of this line of development are:—

Departments.—A Department of Reconstruction, established in 1944, was amalgamated a year later with the Department of Munitions and Supply to form the Department of Reconstruction and Supply, charged with liquidating the Government's commitments arising out of the War and with the continuing function of assisting in the formulation of plans designed to maintain a high level of employment and income (see pp. 1113-1119). Duties discharged by the Department of Pensions and National Health were taken over on a much expanded basis by two new departments set up in 1944—the Departments of Veterans Affairs and of National Health and Welfare (see Chapters XXIX and VII). The reconstitution of one single Department of National Defence at the end of the War involved a closer integration of the three Armed Services and was followed by the establishment of a Defence Research Board to co-ordinate military research and development and an Industrial Defence Board to co-ordinate plans for rapid industrial and economic mobilization in the event of war (see Chapter XXVIII).

*Crown Companies and Boards.**—Among the Crown Companies and Boards established during or after the War to discharge duties that the Government wished to decentralize are (1) Canadian Arsenals Limited, which develops and provides weapons for the Armed Forces, (2) Canadian Commercial Corporation, a purchasing and sales organization, (3) the Export Credits Insurance Corporation, which writes insurance against credit losses on exports or agreements to export general commodities or capital goods, (4) Polymer Corporation Limited, manufacturing synthetic rubber, (5) Eldorado Mining and Refining (1944), Limited, which mines and refines uranium ore, (6) the Atomic Energy Commission, to control the production and use of radio-active materials, (7) the Dominion Coal Board, established to assist the coal industry, (8) the Canadian Maritime Commission, dealing with problems peculiar to the shipbuilding and merchant shipping industries, (9) the Industrial Development Bank, to assist financially small and medium-sized business enterprises and (10) Central Mortgage and Housing Corporation, to co-ordinate federal housing policy and to administer federal housing enterprises and enactments.

Economic Analysis.—To help formulate a program for maintaining a high level of employment and income in the country, there has been a marked development since the end of the War of economic forecasting and a close follow-up of economic development. The Economic Research Branch, created within the Department of Reconstruction (later the Department of Reconstruction and Supply) and recently transferred to the Department of Trade and Commerce, undertakes to forecast levels of employment and income, exports and imports, investment and consumer expenditures, supply of labour and materials, progress of industrial development, changes in cost-price and supply-demand relations, productivity, inventory holdings, and savings habits of the Canadian people. This information is assembled into national forecasts of employment and income and supplemented by special reviews of the outlook for development of major economic regions and the more important industries. Other Government departments assist the Economic Research Branch

* See also pp. 1117-1118, and 1947 Year Book, pp. 1107-1108.

in this work by preparing and assessing outlook information in the economic fields in which they specialize. Starting in 1946, the Economic Research Branch has made an annual forecast of the probable level of private investment. In 1948 this was expanded to cover public investment. In 1947 and 1948 the investment forecast was supplemented by a forecast of the probable levels of production of critical basic and building materials. The Dominion Bureau of Statistics developed, during the war years, a system of "national accounts" of annual gross product and gross expenditure of the economy and is steadily expanding the detail, thereby providing a useful tool of analysis to assist both the Government and the business community in formulating their respective plans.

Fiscal Policy.—In line with the policy of helping to maintain a high and stable level of employment and income, the Government is placing greater emphasis on economic considerations in formulating fiscal policies. In particular, budgeting now takes account of a period longer than one year and operates on an anti-cyclical basis, i.e., calls for budget surpluses and debt reduction in periods of buoyant employment and income and for deficits and debt increases when unemployment and lower levels of income threaten. Surpluses have been realized in the years 1947 and 1948. There have been, nevertheless, a number of reductions in tax rates and other tax concessions have been granted, particularly of the type that would encourage private investment and saving. In 1948, Parliament passed new income-tax legislation which simplified the administration of direct taxes. Interest rates have been maintained at a low rate to encourage private investment. During 1945, the rate on long-term Government bonds was lowered from around 3 p.c. to nearly 2.5 p.c. In 1948, however, in the face of steady inflationary pressure, the rate was allowed to rise to nearly 3 p.c.

The Government has attempted in the post-war period to arrive at a new division of the field of taxation between the Federal and the Provincial Governments. The Provincial Governments vacated the income and corporation tax fields during the War in return for certain Federal Government grants. At the Dominion-Provincial Conference on Reconstruction in the autumn of 1945, the Government proposed that the Provincial Governments withdraw from these two fields and the succession duty field in return for annual subsidies that would not fall below certain minima and would rise proportionately with population and increases in per capita gross national product. No agreement could be reached. In Chapter III, pp. 117-122, the circumstances are reviewed together with the Budget proposals of June, 1946, whereby the Government offered to enter into tax agreements with the provinces on an individual basis, and subsequent agreements reached with seven of the nine provinces under the Dominion-Provincial Tax Rentals Act (11 Geo. VI, c. 58).

Private and Public Investment

When the War ended, there was need for an enormous capital outlay to modernize and expand plant and equipment so that it could support a high level of employment and income. Those industries associated directly with the war effort had received substantial amounts of investment during the War. Expanded war plant needed to be adapted to peacetime production. Industries not actually engaged in war production had received only limited investment over a period of fifteen years and in most cases had overworked their equipment during the war years.

SIGNIFICANT ECONOMIC FACTORS

1935 - 48

INDEX
1935-9=100

INDEX
1935-9=100

Residential investment had been so low in the depression and war years that it was much below current needs of the increased number of families without taking into account population movements and the obsolescence of existing houses. Compared with the late 1920's, the investment expenditures of governments remained low until 1937, when large amounts were spent on relief works. When war broke out, public investment of a non-war character was limited to the maintenance of essential services.

Realizing both the necessity of increasing Canada's physical assets and the important direct and secondary effects of the level of investment on the country's general prosperity, the Government's post-war policy for encouraging private investment has been comprehensive. At the same time, the Federal Government's own investment policy has been so designed as to complement but not compete with private investment. Government assistance to private investment has been of three types:—

Taxation Relief and Concessions.—To encourage investment, certain of the War budgets, particularly that of 1944, made a large number of concessions from the high levels of war and post-war direct taxes on business. The most significant of these concessions from the point of view of the business community has been the privilege of writing off certain types of new investment at special rates of depreciation for income tax purposes. This privilege was available from Nov. 10, 1944, to Mar. 31, 1947, on investment projects completed before Mar. 31, 1949. Some 4,200 companies availed themselves of this privilege on 8,000 projects worth \$1,400,000,000.* Starting with the year 1946 the rate of 100 p.c. on excess profits was lowered and in 1948 the tax was dropped entirely.

Financial Assistance.—Financial assistance for purposes of industrial development was made available through the Industrial Development Bank (see pp. 1026-1027) and for other kinds of investment under the Canadian Farm Loan Act, 1927, the Farm Improvement Loan Act, 1944, the National Housing Act, 1944, and legislation in favour of war veterans (see Chapters X, XVII and XXIX).

Supplies of Capital Goods.—The Government has been active in increasing the available supply of building materials and machinery. The rapid disposal of surplus war plants and equipment, machine tools, trucks, ships, etc., and the strict limits placed on the Federal Government's public investment program have increased the flow of capital goods into private channels. The controllers of basic materials and the Building Materials Co-ordinator of the Department of Trade and Commerce (formerly of the Department of Reconstruction and Supply) are concerned primarily with boosting the production of iron, steel, timber and other basic products and with allocating them so as to ensure a large and increasing flow of capital goods to both domestic and foreign markets. When it became necessary to impose austerity measures in November, 1947 (see p. 946), to conserve foreign exchange, capital goods imports were placed under a licensing system so as not to limit arbitrarily this type of import and to ensure that the goods admitted went to uses that would contribute most to Canada's long-term welfare.

Plans have been worked out and put into operation for the planning and timing of Federal Government investments. In the presence of a high level of economic activity since the end of the War, outlays on public works and resources development

* *Encouragement to Industrial Expansion in Canada*, Department of Reconstruction and Supply, 1948.

have been kept to a minimum. In the meantime, the Government has gone ahead with the planning of projects for implementation when economic activity shows signs of slackening. Fully planned projects registered on the reserve "shelf" of the Public Projects Branch involve expenditures in excess of \$100,000,000.

This Government policy of planned and timed public investment as an anti-cyclical measure envisages similar action by the provinces and municipalities. To this end, the Government proposed at the Dominion-Provincial Conference in 1945 an appropriate division of responsibility between governments or the working out of methods of co-operation, and offered technical and financial assistance in planning and timing investment. The Government's proposals have yet to be agreed upon and implemented.

Details on the levels of private and public investment since the end of the War will be found at pp. 1059-1063 of the 1947 Year Book. The forecast for investment in 1948 has been published and is obtainable by application to the Economic Research and Development Branch of the Department of Trade and Commerce, Ottawa.

Foreign Trade

Broadly speaking, one-third of Canada's national income is derived from foreign trade, a degree of dependence on external economic conditions equalled in only two or three other countries of the world. The Government's short-term policies have been aimed at assisting Western European countries to stabilize their economies, and at protecting Canada's foreign exchange position until Western Europe can trade on a cash basis. Long-term trade policies seek to establish international commerce at the highest level possible on a multilateral basis, and to fit Canada's foreign trade into world trade on favourable terms. (See Chapter XXI.)

Foreign Exchange Difficulties.—Canada's foreign trade reached record proportions during the War. In 1944, exports were valued at \$3,483,000,000 and imports at \$1,759,000,000, for a total trade of \$5,242,000,000. Trade fell off as the need for war materials dropped, but by 1947 the total had passed the 1944 level, reaching \$5,386,000,000—\$2,812,000,000 exports and \$2,574,000,000 imports. However, where the excess of exports over imports had yielded a visible balance of trade in Canada's favour of \$1,724,000,000 in 1944, it yielded only \$238,000,000 in 1947. Since a considerable part of the exports to wartime allies was being financed by Canadian loans in the latter year, the foreign exchange earned by the exports was not enough to pay for imports. On the other hand, had Canada and the United States not been prepared to make loans, the revival of European trade would have been delayed for a good many years with serious long-term loss to Canada in the form of a smaller export market. Canada's loans under the Export Credits Insurance Act were in excess of \$1,800,000,000, of which \$1,250,000,000 was for the United Kingdom. Most of the loans had been used or pledged by the end of 1947 when it was found necessary to place restrictions on the use of remaining funds. However, in January, 1949, it was announced that drawings on the unused portion of the United Kingdom loan would be resumed at the rate of \$10,000,000 a month.

The most serious aspect of the failure of exports to pay for imports was the fact that Canada was obtaining relatively less foreign exchange of the type needed to pay for imports from the United States, i.e., American dollars. There were three reasons for this. Firstly, the value of imports in 1947 was about four times its

1939 level compared to a threefold increase in exports. Secondly, about four-fifths of the imports came from the United States and had to be paid for in hard currency, against two-thirds before the War. Thirdly, the volume of exports to the United States had dropped from the pre-war level of one-third of the total to one-quarter.

Canada's foreign exchange problem came to a head in 1947. During the course of the year the gap between receipts and payments on current international account was such that it was necessary to draw on a reserve of American dollars and gold to the extent of \$743,000,000, leaving \$502,000,000 in the reserve at the end of the year. The course of action taken in November, 1947, to meet the situation was threefold—control of imports, restrictions on extension of credit to foreign governments, and restrictions on the amount of foreign exchange that Canadian travellers could take out of the country.

The import controls consisted of prohibition of certain types of imports and the admission of others under quotas and the licensing of imports of capital goods and some basic materials and parts. The Government also sought the co-operation of business to bring about a correction of the foreign exchange position more quickly by importing wherever possible from the non-dollar area and by increasing exports to the dollar area. The result of this program is reflected in 1947 and 1948 trade with the United States. Exports to that country increased from \$1,057,000,000 in 1947 to \$1,522,000,000 in 1948, while imports dropped from \$1,975,000,000 to \$1,808,000,000, reducing the unfavourable balance of commodity trade from \$918,000,000 to \$286,000,000.

Canada's participation in the European Recovery Program, started in mid-year 1948, had the effect of maintaining the level of exports and of increasing the receipt of American dollars. To ensure supplies of exportable goods for shipment to countries participating in the European Recovery Program, a system of export controls was applied in the latter part of 1948. It operates selectively with respect to both type of export and country of destination.

Long-Term Trade Prospects.—The Government has been aware of the substantial shifts in foreign trade that are inevitable as a result of the War and is attempting to meet them, firstly, by vigorously encouraging exports and, secondly, by supporting international efforts aimed at attaining a high level of world trade.

Among the steps taken to encourage trade, and particularly exports, are: (1) strengthening the Department of Trade and Commerce by incorporating several units from the Department of Reconstruction and Supply, by establishing import and industrial development divisions, and by adding personnel to certain divisions; (2) expanding the Trade Commissioner Service, which now has representatives in 42 offices throughout the world; (3) sponsoring a World Trade Fair in 1948, the first event of its kind on this Continent, and one that may be continued as an annual event; (4) extending export credits to wartime allies; (5) providing insurance for exports or agreements to export; and (6) continuing long-term food commodity contracts with the United Kingdom.

Canada favours a multilateral approach to the solution of international trading problems and has supported actively the various organizations in the commercial field sponsored by the United Nations. Canada was host to the first session of the conference of the Food and Agriculture Organization and is one of the most active

members of the permanent organization. The Dominion participated in the formulation of the Bretton Woods Agreement and became a member of the International Bank for Reconstruction and Development and the International Monetary Fund established under the Agreement. Also Canada was one of the "Big Three" in the deliberations during 1947 that resulted respectively in the General Agreement on Tariffs and Trade (see pp. 873-875) and the Charter of the International Trade Organization—placed provisionally in effect by all the signatory countries, except Chile, by the end of 1948.

The ratification of these two international agreements would materially assist Canada in readjusting her post-war trade, since the idea behind both is that international trade should be conducted as far as possible on a non-discriminatory most-favoured-nation basis. Most of the tariff concessions granted under the 20 schedules of the General Agreement on Tariffs and Trade have been put into effect provisionally by the contracting parties to the Agreement. Canada extended provisionally to the other countries concessions on about 1,000 of the 2,000 items in the tariff of which about one-half represented a reduction of most-favoured-nation rates and the other half a binding of existing rates against increase. The concessions cover about two-thirds by value of Canada's imports. In return, concessions on three-quarters of the value of Canada's exports were received from the other contracting parties to the Agreement.

At present, Canada conducts trade under formal arrangements of one kind or another with 49 countries, with all of which, except Paraguay, most-favoured-nation treatment is exchanged. (See Chapter XXI.)

Special Problems of Industry

The high level of economic activity that has prevailed since the end of the War has minimized the development of unfavourable economic conditions in Canadian industry generally. A notable exception has been gold mining, where rising costs and a fixed price for the product made it unprofitable to operate the lower-grade properties. The Government made provision in 1948 to give financial assistance to overcome increasing costs.

The shipbuilding industry, greatly expanded during the war period, was able to maintain a considerable volume of production after the War, but operations declined in late 1948 as foreign orders neared completion. With foreign exchange difficulties spreading more widely throughout the world, the Canadian flag fleet also experienced declining business and revenues during 1948. In 1947, a Canadian Maritime Commission was established to recommend policies and measures for the operation, maintenance, manning and development of a merchant marine and a shipbuilding and ship repair industry and to administer steamship subventions. When special rates of depreciation for income tax purposes were cut off at Mar. 31, 1947, the provision was continued with respect to ships acquired from War Assets Corporation or built in Canadian shipyards in the period Apr. 1, 1947, to Dec. 31, 1948. Because some net decrease in the size of the Canadian merchant fleet seemed necessary and to encourage replacement of older wartime vessels with more expensive but more efficient modern ships, Canadian shipping companies have been permitted to sell out of Canadian registry a number of ships previously acquired from War Assets Corporation. To ensure that the funds so

realized will be spent in Canadian shipyards, provided they can supply suitable replacements, there is a provision that orders placed abroad must be approved by the Canadian Maritime Commission.

The most far-reaching development in the field of special problems of industry has been the Government's efforts to provide a more stable economic base for farming and fishing communities than was found to exist during the depression years before the War. In respect to the farming community, for example, it has involved such things as spreading the flow of income to Western Canadian grain growers more evenly through the payments policy of the Wheat Board; the development of a system of agricultural commodity contracts with the United Kingdom; the provision of irrigation and other water utilization projects and an attempt at better land utilization through projects under the Prairie Farms Rehabilitation Act and the Eastern Rocky Mountains Forest Conservation Act; the assurance of fair prices for agricultural products by means of the Agricultural Prices Support Act; and greater facilities for obtaining short-term and intermediate loans provided for under the Farm Improvement Loans Act. Similar provisions have been made for fishermen where applicable.

The report in 1947 of a Royal Commission inquiry into the coal industry was followed in the same year by an Act*, establishing a Dominion Coal Board (see p. 452) to absorb the functions of the Dominion Fuel Board and keep the production and marketing of coal in Canada under continuous review. The Board administers coal subventions and advises the Government on a flexible policy designed to meet the varying coal needs of the major economic regions of the country. An important section of the Act gives the Government wide powers of control over coal and fuel oils upon proclamation of a fuel emergency by the Governor in Council.

The Labour Market

The Canadian labour force increased from a total of 4,946,000 in 1946 to 5,017,000 in 1948. The change represented an increase in civilian employment of 227,000—from 4,652,000 to 4,879,000—allowance being made for the decrease over the two years in the other two components of the labour force—a decrease in the strength of the Armed Forces from 151,000 to 36,000 and in the number of unemployed from 143,000 to 102,000. Unemployment in all three post-war years has been at a relatively low figure; it represented about 3 p.c. of the civilian labour force in 1946, and dropped to about 2 p.c. in the two succeeding years. (See also Chapter XVIII.)

Part of the increase in the working force was recruited from the flow of immigrants into the country (see Chapter V), but the increment is not known because of incomplete data on the numbers withdrawn from the working force through emigration. Over the three years 1946-48, the total number of immigrants was about 260,000, of whom 80 p.c.—about 94,000 males and 114,000 females—were 15 years of age or over.

* Geo. VI, c. 57, July 17, 1947.

The composition of the labour force has been subject to considerable change since the end of the War. The proportion of women in employment has dropped from wartime levels. The agricultural labour force declined from 1,186,000 in 1946 to 1,096,000 in 1948—a proportionate decrease from 25 p.c. of the civilian labour force to 22 p.c. Among non-agricultural industries, large absolute gains in the number employed have occurred in manufacturing, construction (particularly building construction), and in transportation and communications. In the group of manufacturing industries, markedly more than average gains have been made in the durable goods sector. Regionally, Ontario and British Columbia have registered both absolute and proportionate increases in the civilian labour force, while the reverse is true of the Prairie Provinces. Ontario had 35.2 p.c. of the total Canadian labour force in 1948, compared with 34.4 p.c. in 1946; British Columbia 9.0 p.c. in 1948, against 8.0 p.c. in 1946; the Prairie Provinces 19.5 p.c. in 1948, against 20.6 p.c. in 1946. Quebec and the Maritimes registered absolute increases in the working force but little change relatively; Quebec's proportion of the labour force remained unchanged at 27.8 p.c., and the Maritimes' showed a percentage decrease from 9.0 to 8.8. The post-war changes in the regional distribution of the working force continued the general trend that prevailed during the 1930's and also the war years. In 1947, the Government assisted workers to move from the Cape Breton Island industrial area to the mining and industrial areas of central Canada. This relieved unemployment on the one hand and helped satisfy a labour shortage on the other. About 2,650 persons were involved, of whom 300 were women.

Weekly wages and salaries in eight leading industries increased by 32 p.c. in the three years from the end of 1945.* Over the same period of time, the cost-of-living index increased by 33 p.c., indicating little change in real income for the workers involved, as a group. During the years 1946-48 there has been a general decrease in average hours worked per week but, with the exception of a few industries, the decrease has been moderate. Time lost in labour disputes reached an all-time high in 1946 but registered successive decreases in 1947 and 1948.

The scope of the Federal Government's activities in the labour field was curtailed after the War with the dropping of controls over manpower and wages and the surrender of jurisdiction over labour-management relations falling within the scope of provincial powers. In 1948, however, Parliament passed the Industrial Relations and Disputes Investigation Act. The Act, which repeals the Industrial Disputes Investigation Act, is in effect a codification of practices that developed before and during the War for the settlement of labour-management differences where government agencies are brought in as third parties. The application of the Act is limited to workers in industries under Federal Government jurisdiction or placed under its jurisdiction by the provinces. One of the objectives behind the legislation is that it may serve as a model for similar legislation by provinces.

The scope of activity of the National Employment Service continues to widen. It has added a division to assist in finding and placing professional and technical workers, and has given a good deal of attention to placement problems of older and partially unemployable workers. It has also been active in encouraging the development of vocational guidance and vocational rehabilitation.

* *Statistics of Average Hours Worked and Average Hourly Earnings*, published by the Dominion Bureau of Statistics.

Social Security

The Government, in the White Paper on *Employment and Income* (referred to at p. xxix) and in its proposals to the Dominion-Provincial Conference on Reconstruction, gave support to a broadly based development of additional social security measures for humanitarian reasons and as a contribution to economic stability through maintenance of production, income and employment and the equitable distribution of purchasing power.

Three important steps were taken to extend social security measures during the war years. These were: the establishment of Unemployment Insurance and a National Employment Service in 1941; a National Physical Fitness Program in 1943; and Family Allowances in 1944.

In 1945 the Government put forward proposals that included a program for veterans' rehabilitation, national health grants and health insurance, unemployment assistance, assistance to the aged, and housing. Owing to the failure of the Federal and Provincial Governments to reach agreement, the social security measures have been implemented in part only.

All these matters are developed in detail in the Health and Welfare Chapters of this and previous editions of the Year Book. Veterans' rehabilitation, an exclusively Federal responsibility, is dealt with in Chapter XXIX.

In 1948 the Dominion laid its proposal for health grants before Parliament, and it was subsequently accepted by all the provinces. Under this scheme the Federal Government makes grants to the provinces for a health survey, general public health, tuberculosis control, mental health care, venereal disease control, crippled children care, cancer control, training of professional workers, public health research and hospital construction. In each case, provincial authorities are required to make a contribution.

The Government proposal with respect to unemployment assistance was that the Federal Government should take over responsibility for all employable unemployed by means of unemployment insurance where possible and otherwise by special unemployment assistance, while provincial and municipal authorities should care for unemployables and residual groups. Additionally, it was proposed that the facilities of the Employment Service be extended and that employers be required to report vacancies, engagements and separations to the Service; and that vocational guidance be provided, the farm labour placement program continued, occupational rehabilitation developed, and vocational training extended on a joint Dominion-provincial basis. The latter proposals have all been implemented or started. The proposals that the Federal Government take over responsibility for employables and the provinces for unemployables has not been settled. However, the Government has continued to bring more workers within the scope of unemployment insurance, as, for example, inland and ocean seamen, stevedores and monthly-rated employees earning up to \$3,120 a year against \$2,400 previously. Provision has also been made for a wider interpretation of a "dependent" for unemployment insurance purposes, permissible supplementary earnings have been increased from \$1.00 to \$1.50 per day, increased benefits provided, and contribution rates revised.

A Federal Government proposal that it assume exclusive jurisdiction over the provision of old-age pensions for persons over 70 without a means test, and share with the provinces the cost of caring for the needy of between 65 and 70 years of age is also in abeyance. However, in 1947 the Government assumed three-quarters of the cost of old-age and blind pensions up to \$30 a month, an increase over the previous basic pension rate of \$5 per month. At the same time the aggregate permissible annual income from pensions and other sources was increased and is now \$600 for single persons and \$1,200 for married persons (see pp. 258-259).

Finally, a proposal that co-ordinated action be taken on a housing program, including community planning, uniform building by-laws, low-rent housing projects, and slum clearance has yet to be implemented. Under the National Housing Act, 1944, the Government had made unilateral provision covering these points. In the absence of agreement, the basic provisions of the legislation have been allowed to stand. Partly as a result of the serious housing shortage that has existed and partly because of the terms under which house building can be undertaken as a result of the financial provisions of the Act, Canada has had the largest housing program in its history.* In fact, a larger proportion of total investment has gone into house building than into manufacturing, the utility industries, or the primary industries. More than 210,000 housing units and 18,000 conversions have been completed in the three years 1946-48. (See Chapter XVII for details.)

* *Housing in Canada*, a quarterly publication of the Central Mortgage and Housing Corporation, Ottawa, provides current information on the progress of the Canadian housing program.

PART I.—GEOGRAPHY*

Main Geographical Features.—Canada comprises the whole northern part of the North American Continent with its islands, except the United States territory of Alaska and the territory of Newfoundland (with Labrador). It embraces the whole Arctic Archipelago between Davis Strait and the connecting waters northward to the 60th meridian on the east and the 141st meridian on the west.

Canada is bounded on the west by the Pacific Ocean and Alaska; on the south by the United States; on the east by the Atlantic Ocean, the waters between Newfoundland and the Gulf of St. Lawrence, Labrador, Davis Strait and the dividing waters between Ellesmere Island and the Danish territory of Greenland; northward it extends to the North Pole.

The southernmost point is Middle Island in Lake Erie, in north latitude 41°41'. From east to west Canada extends from about west longitude 57° at the Strait of Belle Isle to west longitude 141°, the boundary of Alaska. Canadian territory thus extends over 48° of latitude and 84° of longitude.

The area of the Dominion is 3,690,410 square miles, a figure that may be compared with that of 3,608,787 square miles for Continental United States and Alaska; 3,776,700 the total area of Europe; 2,974,514 the area of Australia; 3,275,510 the area of Brazil; 1,581,079 the area of the Dominions of India and Pakistan (excluding Burma); 120,849 the area of the British Isles. Canada's area is about 28 p.c. of the total area of the British Commonwealth.

The sea coast of Canada, one of the longest of any country in the world, comprises the following mileages:—

Mainland—Atlantic 3,068, Pacific 1,579, Hudson Strait 1,245, Hudson Bay 3,157, Arctic 5,771; total 14,820 miles.

Islands— Atlantic 1,518, Pacific 3,979, Hudson Strait 60, Hudson Bay 2,307, Arctic 26,786; total 34,650 miles.

* Revised by F. H. Peters, Chief, Surveys and Mapping Bureau, Department of Mines and Resources, Ottawa.

The Canada-United States Boundary is 3,986·8 miles long and that between Canada and Alaska is 1,539·8 miles; the Canada-Labrador Boundary has not been surveyed but is estimated at 1,990 miles.

The St. Lawrence-Great Lakes system of navigable waterways provides ship transportation from the sea into the very heart of the continent. From the Strait of Belle Isle at the northern entrance to the Gulf of St. Lawrence, the sailing distance to the head of Lake Superior is 2,338 miles; from Montreal, Que., to Fort William, Ont., the great Canadian grain-shipping port, the distance is 1,215 miles. Throughout its length the waterway gives access to a region rich in natural and industrial resources.

The potentialities of these inland waterways of Canada are enormous since modern canal systems by-pass the unnavigable portions of the St. Lawrence River, link up the various bodies of water of the Great Lakes and have a great economic influence on the wealth and progress of the nation. There are no tides in these Lakes although considerable variation in water levels is sometimes occasioned by strong winds or heavy precipitation. At the Great Lakes ports and harbours, ships load and unload their cargoes to and from all points in Canada.

¹ Too small to be enumerated.

Section 1.—Physical Geography

The physical features of Canada are considered under this heading in the six natural divisions into which the country is divided, as shown on the map p. 4.

(1) The Appalachian Region, comprising the Maritime Provinces and most of that part of Quebec lying south of the St. Lawrence River is a hilly or mountainous region and is made up largely of disturbed beds.

(2) The St. Lawrence Region, a lowland belt bordering the St. Lawrence River and extending westward through southern Ontario to Lake Huron, is underlain chiefly by flat or gently dipping strata of Palæozoic age.

(3) The Canadian Shield is a vast V-shaped area of ancient rocks surrounding Hudson Bay.

(4) The Interior Plains Region of Manitoba, Saskatchewan, and Alberta stretches down Mackenzie Valley to the Arctic Ocean and is underlain by only slightly disturbed Palæozoic and Mesozoic strata.

(5) The Cordilleran Region, including the mountainous country of the Pacific Coast, is developed on highly disturbed rocks.

(6) The Arctic Archipelago, with which is linked the Hudson Bay Lowland, includes the islands lying north of the Canadian Shield, and a broad, flat region, underlain by flat-lying Palæozoic beds, along the southern shore of Hudson Bay.

The physiographic details and geology of each division described above are given at pp. 19-29, in the 1947 edition of the Year Book.

Subsection 1.—Hydrographical Features

The hydrographical features of Canada are described in detail at pp. 3-12 of the 1947 edition of the Year Book.

Subsection 2.—Lakes and Rivers

The fresh-water area of Canada is unusually large constituting over 6 p.c. of the total area of the country. The outstanding feature is the Great Lakes, details concerning which are given in Table 2. These lakes, with the St. Lawrence River, form the most important system of waterways on the continent and one of the world's most notable fresh-water transportation routes.

2.—Areas, Elevations, and Depths of the Great Lakes

Lake	Elevation Above Sea-level	Length	Breadth	Maximum Depth	Total Area	Area on Canadian Side of Boundary
	ft.	miles	miles	ft.	sq. miles	sq. miles
Superior.....	602-23	383	160	1,302	31,820	11,200
Michigan.....	580-77	321	118	923	22,400	Nil
Huron.....	580-77	247	101	750	23,010	13,675
St. Clair.....	575-30	26	24	23	460	270
Erie.....	572-40	241	57	210	9,940	5,094
Ontario.....	245-88	193	53	774	7,540	3,727

Lake Superior, with an area of 31,820 square miles, is the largest body of fresh water in the world. The International Boundary between Canada and the United States passes through the waters of Lakes Superior, Huron, St. Clair, Erie and Ontario. The great obstacle to navigation on this waterway—the rise of 326 feet between Lakes Ontario and Erie—is surmounted by the Welland Ship Canal, the Niagara River dropping over the escarpment at Niagara creates the famous Niagara

- Arctic Archipelago and Hudson Bay Lowland

Falls. In addition to the Great Lakes there are many other remarkably large lakes; the following eleven, with their areas in square miles in parentheses, are all over 1,000 square miles in area: Great Bear (12,000), Great Slave (11,170), Winnipeg (9,398), Athabaska (3,058), Reindeer (2,444), Winnipegosis (2,086), Nipigon (1,870), Manitoba (1,817), Dubawnt (1,600), Lake of the Woods (1,346) and Southern Indian (1,060). Apart from these, named as notable for their size, there are innumerable other lakes scattered all over that major portion of the area of Canada lying within the Canadian Shield. In an area of 6,094 square miles, accurately mapped, just south and east of Lake Winnipeg, there are 3,000 lakes; in an area of 5,294 square miles, accurately mapped, southwest of Reindeer Lake in Saskatchewan, there are 7,500 lakes. A list of the principal lakes of Canada, by provinces, with their elevations and their areas is given at pp. 13-14 of the 1947 edition of the Year Book.

The river systems of Canada, excluding those of the Arctic Archipelago, are best studied by segregating the main drainage basins as shown in Table 3.

3.—Drainage Basins in Canada

NOTE.—Classified by the Dominion Water and Power Bureau, Department of Mines and Resources Ottawa.

Drainage Basin	Area Drained ¹	Drainage Basin	Area Drained ¹

Total.....	1,379,160	Area, Canada Less Arctic Archipelago	3,157,662

¹ Areas are approximate and are exclusive of those portions of the basins of all rivers that lie in United States territory.

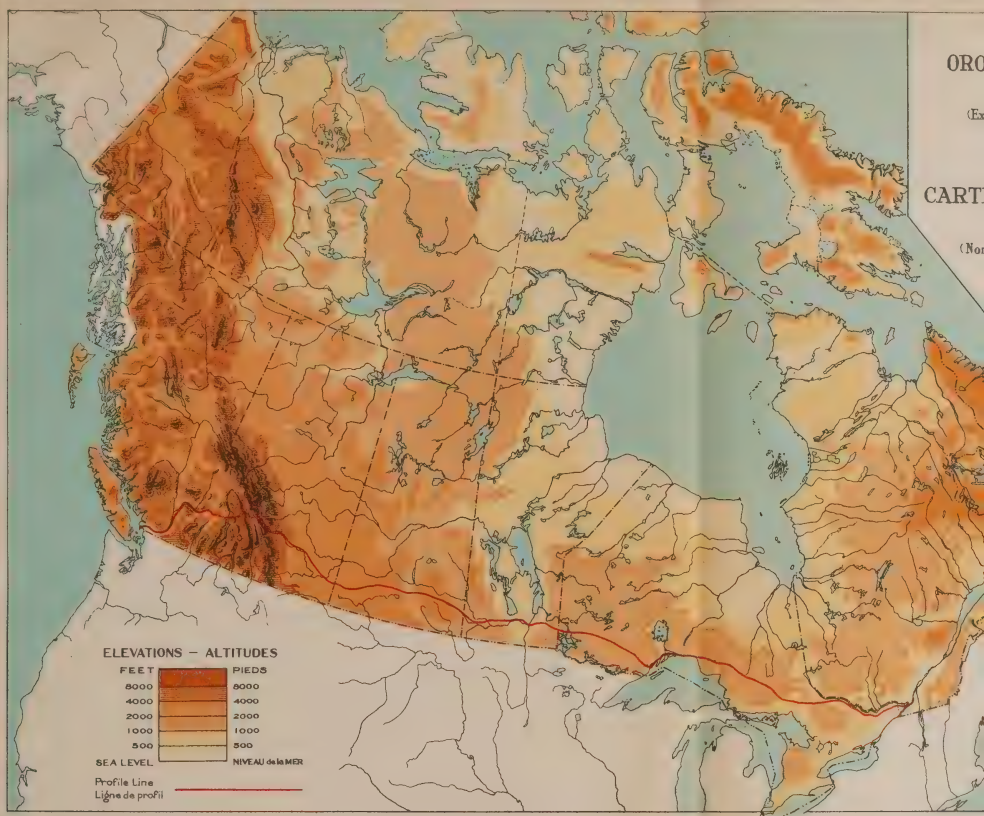

The greater part of Canada drains into Hudson Bay and the Arctic Ocean; the Nelson River drainage is exceptional in running *through* the most arable and the most settled part of Western Canada, but otherwise the rivers of the West, east of the Rockies run *away* from the settled areas towards the cold northern salt waters and this adversely affects their industrial utility. The Mackenzie, which drains Great Slave Lake is, with its headwaters, the longest river in Canada (2,514 miles) and its valley constitutes the natural transportation route through the North-west Territories down to the Arctic Ocean. From Fort Smith, on the Slave River, large river boats run without any obstruction down to Aklavik in the delta of the Mackenzie, a distance of 1,292 miles. In Eastern Canada, the Great Lakes and St. Lawrence drainage basin dominates all others and has undergone the greatest

development. The St. Lawrence River and the Great Lakes provide a water route from the Atlantic as far as Fort William and Port Arthur, Ont., twin cities situated on Lake Superior and only 419 miles from Winnipeg, Man., the half-way mark in distance across Canada. The main tributaries of the St. Lawrence all flowing south (most of which have lakes available for reservoiring), together with the main river itself, have developed and undeveloped water powers the economic value of which it would be difficult to over-estimate. Apart from the plains region of the West, the rivers of Canada have a vast power potentiality well distributed over the country. Table 4 gives the lengths of the principal rivers with their tributaries classified according to the four major drainage basins.

4.—Lengths of Principal Rivers and Tributaries in Canada

NOTE.—In this table the tributaries and sub-tributaries are indicated by indentation of the names. Thus the Ottawa and other rivers are shown as tributary to the St. Lawrence, and the Gatineau and other rivers as tributary to the Ottawa.

¹ The enumerated peaks in Yukon are on or near the Yukon-Alaska Boundary.

There are no other elevations in Canada that come near rivalling those of the Cordilleran Region. Only small areas in northeastern Quebec rise above 2,000 feet in elevation; there are no great eminences, but the surface is generally accidented by many hills and hollows with countless numbers of lakes and streams.

South and east of the River St. Lawrence, the St. Lawrence Lowlands are bordered by extensions and outliers of the Appalachian Mountains. The Appalachian System, in fact, extends through the Maritime Provinces and the Gaspé Peninsula of Quebec. The whole area may be regarded as a peninsula jutting out with bold and broken coast line to separate the Gulf of St. Lawrence from the Atlantic. Peaks in this area, notably the Notre Dame and the Shickshock Mountains, reach elevations up to 4,000 ft.

Subsection 4.—Islands

The islands of Canada are among its most remarkable geographic features. They include the very large group lying in the Arctic Ocean, the fringe of both large and small islands off the Pacific Coast, those of the Maritime Provinces and Quebec in the Atlantic Ocean and the Gulf of St. Lawrence, together with the islands of the Great Lakes and other inland waters. The Pacific Coast islands, with the exception of Vancouver Island and the Queen Charlotte group, are small and dot the coast of British Columbia from Dixon Entrance to the southern boundary of the Province. Vancouver Island is 285 miles long and from 40 to 80 miles broad, covering an area of about 12,408 square miles; the mountain range which forms its backbone rises again to form the Queen Charlotte Islands farther north. These islands figure largely in the mining, lumbering and fishing industries of the West and, together with the bold and deeply indented coast line, provide a region for superb scenic cruises.

On the eastern coast of the Dominion are the island province of Prince Edward Island, the Islands of Cape Breton (an integral part of Nova Scotia), Anticosti, and the Magdalen group (included in the Province of Quebec), and the Islands of Grand Manan and Campobello (part of the Province of New Brunswick) in the Bay of Fundy. Prince Edward Island is 2,184 sq. miles in area, Cape Breton 3,970 sq. miles and Anticosti 3,043 sq. miles. Fishing activities in these eastern islands are important, while agriculture on Prince Edward Island and mining on Cape Breton are the chief occupations of the inhabitants.

Manitoulin Island, area 1,068 sq. miles, and the Georgian Bay islands in Lake Huron and the Thousand Islands group in the St. Lawrence River, at its outlet from Lake Ontario, are the more important islands of the inland waters.

Table 6 gives the principal islands in Canada having an area of over 2,000 sq. miles.

PHYSICAL GEOGRAPHY OF THE CANADIAN WESTERN ARCTIC*

NOTE.—This article is a companion contribution from the Lands and Development Services Branch, Department of Mines and Resources, to the Article, "Physical Geography of the Canadian Eastern Arctic" that appears at pp. 12-19 of the 1945 Year Book.

The Western Arctic comprises that part of the mainland of northwestern and north-central Canada lying north of the tree-line, and the nearby Arctic Islands. The region includes a strip of Yukon coast and off-shore Herschel Island, the mainland tundra coast of northern Mackenzie District, and the northern coast of Keewatin District as far eastward as Boothia Peninsula and the 95th meridian west longitude. The Western Arctic Islands include Banks, Victoria, King William, and Prince of Wales Islands.

This rectangular region is a treeless Arctic territory. Its physical appearance, although similar to that of many parts of the larger Eastern Arctic which forms the northeastern fifth of Canada, is differentiated from the latter by method of entry. There is very little intercourse between the two Arctic regions as transportation lines, supply routes, and communication in the Western Arctic generally come from the west—either from the Mackenzie Valley or occasionally from around the coast of Alaska. The Western Arctic is also differentiated from the nearby Subarctic and forested Mackenzie Valley, which, in the Northwest Territories, extends from Fort Smith to Aklavik. The physical characteristics and problems of the Mackenzie Valley are quite different from those of the Western Arctic.

There are many contrasts within the Western Arctic region. The mainland and southern parts of the islands have a thinly scattered population of migratory Eskimos and a few white settlements, whereas the northern sections of the islands are uninhabited. The Eskimos who live near the delta of Mackenzie River differ in culture and equipment from the primitive natives of Boothia Peninsula and Back River. Transportation facilities and problems vary throughout the region. Navi-

* Prepared under the direction of R. A. Gibson, Director, Lands and Development Services Branch, Department of Mines and Resources, Ottawa.

gation difficulties encountered along the open coast of Beaufort Sea and Amundsen Gulf are different from those met in the almost-enclosed seas of Coronation Gulf and Queen Maud Gulf. Quite different transportation problems are met in the eastern part of the region north of King William Island. These contrasts illustrate the diversities within an area which has regional unity. A description of the physical character of the country helps to explain the reason for these differences, and at the same time shows the general similarities within the natural environment.

General Geology.—The rocks underlying the Western Arctic are of Precambrian and Palæozoic age. Around Coronation Gulf there appears to be a deep embayment in the Precambrian rocks. The mainland coast from Boothia Peninsula to Darnley Bay, except for a sedimentary strip north of Coppermine and on Kent Peninsula, is composed of rugged or worn Precambrian rocks. East of Coppermine settlement granites and gneisses predominate. On the north side of this basin Precambrian rocks outcrop on the central west coast of Victoria Island and extend in a broad belt across the northern part of the Island to the heads of Richard Collinson Inlet and Hadley Bay, and possibly to the northeastern tip of Victoria Island. Within this basin, Precambrian sedimentary rocks and early Palæozoics, chiefly Ordovician in age, have been deposited.

The best known of the Precambrian rocks in the Western Arctic is the Coppermine Series. They outcrop on both sides of the Coppermine River and extend eastward. The rocks have a gentle dip towards the north. Northeast of Great Bear Lake, they have been eroded into linear hills known as the Copper Mountains. These hills have steep, south-facing cliffs, and gentle northward slopes terminating in drift-filled valleys. The mountains are composed of a series of superimposed flows of basaltic lavas. A similar type of topography, unidentified as to age, is located 40 miles east of the junction of Coppermine and Hepburn Rivers. There the escarpments face eastward. North of Copper Mountains, Precambrian shale and limestone overlie the basalts of the Coppermine Series. Basaltic rocks of similar appearance outcrop again on southern Victoria Island at Richardson Island and west of Cambridge Bay, but they do not constitute the whole south coast of the Island.

Palæozoic rock, largely unclassified as to age, underlies the remainder of the Western Arctic Islands, and a mainland coastal section northwest of Coppermine. It is probable, however, that more recent rocks of Cenozoic age have been laid down in parts of Banks and northwest Victoria Islands. The detailed geology of much of the Western Arctic, particularly identification of the sedimentary rocks, is as yet imperfectly known.

Rocks of Ordovician age have been reported from the flat west coast of Boothia Peninsula and on part of low King William Island. Fossils found in rocks in other parts of King William Island indicate Silurian age. At Read, Liston and Sutton Islands, off the southwest coast of Victoria Island, Ordovician rocks appear again; probably similar rocks can be found on the nearby mainland. Younger rocks have been reported from both the south and north coasts of Banks Island suggesting that much of the Island may be considered post-Silurian in age.

Glaciation.—Although the southern limit of continental glaciation in North America is well established, there is much doubt about the northern boundary. Recent geological work has established the fact that at least the southern part of Victoria Island was glaciated, and possibly the whole Island.* The thickness of

* Washburn, A. L. "Geology of Victoria Island and Adjacent Regions, Arctic Canada". Geological Society of America Memoir 22, 1947.

the ice over Cambridge Bay has been estimated to have been at least 2,000 feet. Evidence of glaciation is obtained from the distribution of erratics, and glacial striæ, especially glacial deposition, including eskers and moraines.

The last direction of movement of the ice can be interpreted by glacial striæ. These scratches in the rock surface of the mainland coast indicate that ice pushed to the northwest. On Victoria Island the recorded striæ point westward and southward suggesting a final centre of dispersal on the Island itself.

Since the melting of the ice-cap of glacial times, the whole Arctic has slowly risen out of the sea. This rise has been recorded by emergent beachlines containing fossil marine shells. In some places these gravel ridges are found as high as 500 to 600 feet above the present sea-level. Many of the present-day coasts, and especially the low coasts of sedimentary rock, are characterized by rows of ancient beachlines rising successively higher inland.

The slow emergence may still be continuing. At Cambridge Bay, a shoal reported by the explorer Collinson in 1852, is now a small islet above water. The rise, in this case, has amounted to about five feet in 100 years. Further evidence of deeper water in the Western Arctic is found in the ancient whalebone houses built by Eskimos around King William Island almost 1,000 years ago. The seas in that area are now too shallow for large whales.

Topography.—Topography in the Western Arctic is characterized by combinations of low, level, grassy plains and rounded, barren, rugged hills. There are no mountainous regions; even the rough hilly country does not exceed 2,000 feet in elevation. The highest elevations are found on western Victoria Island and southern Banks Island. The mainland coast from Yukon Territory to Boothia Peninsula is mainly low and flat, but elsewhere rises abruptly from the water to a height of a few hundred feet.

Along the Yukon coast a low tundra strip about 10 miles wide fronts the rugged Richardson and Buckland Ranges. Numerous small streams cross the rolling plain, and lakes dot its surface. The Mackenzie Delta region and the coast eastward to Baillie Island are very low and swampy. Innumerable small lakes, cut off from the sea by strips of beaches, cover the coastal regions, and shallows extend offshore. A sharp bluff rises along the east side of the Mackenzie Delta, beyond which many small conical hills, called "pingos", are found near Port Brabant (Tuktoyaktuk). The inland country to the west is gently rolling tundra, with numerous lakes filling the depressions in the permanently frozen ground.

The coast east of Baillie Island has steep bluffs rising about 200 feet above the water. The Smoking Mountains along the west side of Franklin Bay are steep hills of about 500 feet altitude. South of Darnley Bay, hills rise to about 1,000 feet and appear more rugged on the coastal side. These hills are actually the eroded front of the Precambrian plateau facing towards the sea: they have very little relief on the south side. The lake-dotted country inland from Horton and Anderson Rivers is a rolling tundra with few major topographic features.

Between Pearce Point and Stapsylton Bay the coast is straight and in many places lined with low cliffs of 50 to 200 feet. In the low sections elevations increase inland in a series of terraces to a rolling interior plateau where altitudes average about 1,000 feet. Tundra vegetation of grasses, sedges and mosses is fairly abundant over the plateau. The coast around Bernard Harbour is flat, rising in series of former beachlines to a rolling grassy interior. Gravel beaches are the main topographic features.

Between Coppermine Settlement and Bathurst Inlet, the coast is more rugged than that to the westward. Rocky cliffs line the south coast of Coronation Gulf, except where broken by river mouths and valley plains. South of Coppermine settlement, the Copper Mountains are linear ranges of hills with south-facing cliffs. Much of the interior country south of the Copper Mountains and extending towards Burnside River consists of barren rocky ridges and drift-filled valleys. South of Burnside River the Peacock Hills, which have an altitude of about 2,000 feet, rise abruptly 500 to 1,000 feet above the rolling plain.

Around Bathurst Inlet rugged hills rise directly from the water, sometimes to over 1,000 feet elevation. The hills decrease in relief inland. Numerous rocky islands fill the Inlet and almost block its mouth. Their precipitous cliffs make a scenic setting of rugged grandeur.

Elevations decrease east of Bathurst Inlet as the rocky hills become lower and the grassy valleys widen. Kent Peninsula is generally low. Its shelving beaches rise from the shallow shores to low rocky hills in the interior. Higher hills of Precambrian rock form the neck of the peninsula, and numerous small rocky islands are sprinkled offshore to the east.

The south coast of Queen Maud Gulf is low and flat. Numerous islands and unmapped shoals are found in the shallow water offshore. The lowland is rocky near the shore and extends far inland in swampy, lake-covered tundra. Several long rivers, some of them entrenched, drain through the area towards the coast. The low divide between these streams and Back River is covered with glacial deposits forming low hills. Southeast of Perry River there is a hilly section consisting of rock ridges rising about 500 feet above the surrounding region. Streams with steep-sided valleys have cut into it. The extent of the hilly section is not known and details are scarce concerning the topography of the inland region.

The only features on low Adelaide Peninsula are disintegrated rock and gravel ridges which indicate ancient beachlines. A similar low coast extends eastward to the mouth of Murchison River. Little is known about the interior country other than the fact that rugged hills are found between Chantrey Inlet and Wager Bay.

East of Rae Strait and along the west coast of Boothia Peninsula as far north as the Tasmania Islands, shelving coasts marked by old beach terraces are common. The rugged Precambrian hills rise abruptly above this plain on the west side of central Boothia Peninsula and occupy the entire northern part of the peninsula north of Wrottesley Inlet. This rough region has barren rocky hills and ridges rising about 1,000 feet above lake-filled, narrow valleys. The west coast of Somerset Island is also rugged and has numerous high, steep, offshore islands.

The whole of King William Island is low. Near the coast the surface consists of broad terraces marking former beaches. Except for a small conical hill east of Gjoa Haven, and slightly higher land on the northwest corner, it is doubtful if any of the island exceeds 400 feet in altitude. Its surface is mantled with broken sedimentary rock and glacial deposits. Lakes fill the depressions above the permanently frozen ground. Shallow water extends offshore in most places, especially along the northeast coast.

Prince of Wales Island has three physiographic divisions. The southern third of the Island is low and flat and is covered with numerous small, shallow lakes. Vegetation is unusually sparse, with much of the exposed surface consisting of disintegrated, angular sedimentary rock in low, flat ridges or domes. Another flat plain is located on the northwest corner of the Island. The central part of the

Island is a plateau of 500 to 1,000 feet altitude, which is deeply incised by numerous streams along the eastern side. There are very few lakes in this section, and many of the stream beds are broad, shallow, gravel-filled valleys. The red escarpment front of the plateau rises abruptly above a narrow lowland west of Browne Bay. The northeastern parts of the Island and the large rocky islands blocking the east side of Browne Bay are high and rugged, possibly reaching 2,000 feet altitude. This rugged section is probably caused by underlying Precambrian rocks which also appear on nearby northwestern Boothia Peninsula and western Somerset Island.

The eastern half of Victoria Island is similar in appearance to King William Island. A low, flat coast rises inland in low, gravel ridges and flattened domes across lake-dotted country. Outstanding hills are only a few hundred feet high. One of the most notable, Mount Pelly, near Cambridge Bay, is 675 feet high, and probably consists of unconsolidated glacial material. The south coast is also low and shelving, except at Richardson Island where Precambrian rocks form low, rugged hills. The eastern interior is also low and is covered with innumerable circular, shallow lakes as far westward as the head of Prince Albert Sound.

Higher hills rise in western Victoria Island. Wollaston Peninsula, north of Dolphin and Union Strait, is rugged in places in the interior. Elevations of about 1,700 feet have been reported. The hills consist of irregular ridges of unconsolidated material. Elevations decrease towards Prince Albert Sound. North of the Sound, ridge and valley topography is characteristic. The broad linear valleys trend to the northeast, and are separated by rocky ridges, sometimes with perpendicular, columnar cliffs. Altitudes are probably about 1,000 feet, but may reach 2,000 feet south of the east end of Minto Inlet. Low hills surround Minto Inlet, and in some places form prominent headlands. Inland, north of the Inlet, a generally rolling plateau is rugged in places. In northwestern Victoria Island rocky hills are cut by many ravines. Wide valleys extend east-west, and are separated by ridges with south-facing escarpments. Lakes are not as numerous in this northwestern region.

The north coast of Victoria Island is only sketchily known. High and precipitous cliffs have been reported between Collinson Inlet and Hadley Bay. A line of higher hills rises inland to about 1,500 feet. Many small rocky islands are found offshore in the bays. The northeastern corner of the Island is a newly-discovered separate large rocky island with elevations of about 1,000 feet.

Banks Island is generally high and rolling, being marked by high cliffs on both the south and north coasts. Highest elevations are found at the south where Nelson Head, the southern cape, rises a sheer 1,000 feet from the water. Rugged hills increase their altitudes inland to about 2,000 feet. The precipitous cliffs and hilly sections of the north coast rise about 600 feet above sea-level. The northern interior is rough and hilly.

The west side of Banks Island has a low flat coast. It slopes gradually inland to low rolling hills of about 1,000 feet altitude. The hills are separated by broad valleys with abundant grassy tundra vegetation. Numerous large rivers drain the interior to the west and north. The east coast is low in the central section, but is rocky and rugged towards the northeast. The northeast interior has less vegetation than central Banks Island. Several flat sandy areas have been reported there.

Climate.—There are only three meteorological stations in the Western Arctic* from which climatic records may be obtained. They are at Cambridge Bay, Coppermine and Holman Island. They indicate that the western part of the region, around Amundsen Gulf, is milder than the interior sections around Queen Maud Gulf. The region has an Arctic climate, which means that no month has an average mean temperature above 50°F. This 50° isotherm for the warmest month is generally found a short distance north of the tree-line.

Old records at the Herschel Island whaling station indicate that its warmest month is below 50°F., and it is, therefore, within the Arctic zone. The treeless, tundra character of the vegetation of Herschel Island and the nearby mainland substantiates this Arctic characteristic.

Aklavik, in the Mackenzie River Delta, has two months when average mean temperatures are above 50°F. This places it in the Subarctic zone. The forested character of the country is further proof of its relatively mild summers. The Arctic line is found somewhere between Aklavik and the barren coast. Although not within the region, the Aklavik figures may be used as characteristic of the coast since there are no other meteorological stations along the western mainland of the Western Arctic. Actual temperatures at the coast would be somewhat lower than the Aklavik figures. East of the Mackenzie Delta the coast and the inland areas between rivers are treeless tundra. Forests finger north along the valleys of the Anderson and Horton Rivers, but do not reach the coast.

Coppermine settlement is in the zone between Arctic and Subarctic. The meteorological station there has an average of 50°F. for July, placing the Settlement on the line between the two climatic regions. Trees are found a short distance inland along the sheltered valley of the Coppermine River, indicating the warmth of the summer months.

Because of inaccessibility, no meteorological stations are located in the vast region of the Canadian mainland east of Coppermine, until Baker Lake and the west coast of Hudson Bay are reached. The tree-line trends away from the Arctic coast to the southeast. It is located north of the east end of Great Slave Lake and continues eastward to the Hudson Bay coast near Churchill. Exactly where the southern limit of the Arctic is in this area is not known, but it probably parallels the tree-line as it does in other regions where there are climatic records.

Summers may be described as cool in the Western Arctic. The four months of June to September have average mean monthly temperatures above 32°F. in the southern parts of the region. In July and early August, afternoon temperatures may rise above 60°F., and usually fall to around 40°F. in the evening. The day-by-day temperature at settlements may depend upon the direction of wind. A wind blowing from the warm land will be milder than a breeze from the cold waters of the Arctic gulfs. Temperatures seldom rise above 65°F. at Cambridge Bay and 70°F. at Holman Island. The absolute maximum recorded at both stations is 75°F. Occasionally during the summer, temperatures may reach almost 80°F. at Coppermine, and the maximum recorded is 87°F.

The change from autumn to winter is very rapid during early October. During that month the lakes and harbours have frozen over and the length of the period of daylight has decreased rapidly. Average mean monthly temperatures drop below zero in November and remain below zero for 5 months at Coppermine, Holman Island and Aklavik, and for 6 months at Cambridge Bay.

* As defined in the opening paragraphs of this article.

February is the coldest month at each of the three Western Arctic weather stations. The monthly mean of -27°F. at Cambridge Bay is one of the coldest known in Canada, being exceeded only slightly by records from stations on northern Baffin Island. Winters, which average between -15°F. and -20°F. during January and February, are not as cold at Coppermine, Holman Island and Aklavik.

Minimum temperatures do not drop as low in the Western Arctic as in the Mackenzie Valley. Holman Island, located on Amundsen Gulf which may occasionally have open water between ice floes, has a usual winter minimum of about -37°F. Lower temperatures are often recorded by settlements in northern Ontario and on the Prairies. The lowest temperature ever recorded at Holman Island is -45°F. Coppermine is colder, having a mean winter minimum of -48°F. , and a record minimum of -54°F. Cambridge Bay has the lowest minimum temperatures known in the whole Canadian Arctic. Nearly every winter readings in the Arctic of about -54°F. are observed, and the lowest recording reported is -63°F. from there.

In April, monthly mean temperatures rise to slightly above zero at all stations except Cambridge Bay. Spring comes quickly as the days become longer in May. Average monthly mean temperatures jump 20 degrees between April and May. The snow begins to melt from southern slopes about mid-May on the mainland. Summer begins in July when the ice breaks up along the coasts and in the lakes.

Since most of the Western Arctic settlements are in the vicinity of latitude 69°N. , they have about the same duration of daylight and darkness. In summer there are 24 hours of light from the latter part of May to the end of July. During this time the sun circles low in the sky, dipping down towards the horizon in the north. By the end of July the sun is setting for a short period in the north. The period of darkness lengthens each day thereafter.

By the first of December the sun no longer rises above the horizon to the south. For the next month there is a period of twilight darkness, brightened by the light of the stars and moon, a twilight glow on the southern horizon, and reflections from the snow. Early in January the sun again peeps above the horizon, and each day thereafter the daylight lasts longer until there is equal day and night on March 21.

Precipitation is not heavy in the Western Arctic. About 10 inches are recorded at Coppermine and Aklavik, half of which falls as rain during the four warmest months. Six and seven inches are recorded by the stations at Cambridge Bay and Holman Island respectively, about one-third of which is rain coming chiefly in July and August. At Coppermine, three inches is the most rain ever recorded in one month, and in dry summers as little as one-half inch has fallen in a month.

Snowfall is difficult to record accurately at all Arctic stations because of the excessive drifting. From 40 to 50 inches is the usual amount which falls during the winter. Northern snow is generally hard and finely crystalline, especially when on the ground. It packs solidly, and where it collects to sufficient depths in depressions or on the sea-ice, can be cut into snow blocks for igloo-building.

Heaviest snowfalls come in October and November, but continue intermittently throughout 10 months of the year. Although a small amount of snow falls, the low winter temperatures and lack of sunlight prevent melting. In rocky, hilly country the ridge tops are often blown free of snow, but a snow cover, which is used for sledge-dog transportation, always remains throughout the winter in the valleys and over the lowlands and sea-ice.

Fog is most frequent during spring and summer months, especially near the coast. When warming air from the land comes in contact with ice-covered or cold seas, condensation occurs and fogs roll out to sea. Fogs are not as frequent a transportation hazard in the Western Arctic, however, as they are in Hudson Strait of the Eastern Arctic. Cambridge Bay and Coppermine average two to three days of fog each month during May, July and August. A maximum in May of eight foggy days at Coppermine and of nine at Cambridge Bay is the greatest number ever reported in one month.

Fogs are rare in the winter months when sea-ice and snow-covered land have about the same temperatures. Visibility is sometimes poor in this season, however, owing to drifting snow. During these "blizzards" all movement ceases, as Eskimo and white travellers wait in snow-houses or in tents for the storm to blow over. On the other hand, many days of spring are clear and bright, with scattered high clouds. This is the best time for travelling provided snow-goggles are worn as a precaution against snow blindness.

Winds blow predominantly from the northwest during the winter at most stations. At Coppermine, however, southwesterly winds are more common in the winter. In summer, winds from the east or northeast occur more frequently in the Western Arctic, but again shift to the northwest in autumn. Calms are more usual in winter than in summer.

Ice Conditions.—As in all Arctic regions, one of the main problems of accessibility is unpredictable ice conditions. For about 9 to 10 months coasts are closed to sea transportation by land-fast ice, and the open gulfs off Beaufort Sea are jammed with heavy ice floes from the shifting pack of the Arctic Ocean. During the short open season, when the ice moves off from the shores of the open coast, and melts in the enclosed seas, navigation is possible. The length of that season, and the degree of accessibility, however, vary greatly from year to year.

Early in September the lakes in the northern parts of the region begin to freeze over; by the end of the month small lakes on the mainland also have an ice-covering. Towards the end of September or early October ice forms across the harbours and inlets, and starts to build out from the shore. By the end of November or early in December, Coronation and Queen Maud Gulfs, and the connecting straits off the mainland coast, are frozen over completely except where there are unusually strong currents. If freeze-up comes during a period of calm, the ice will be hard and level, making an excellent winter highway. If the freeze-up period is stormy, and the ice is broken up several times before finally setting, the resulting ice-cover will be rough and hummocky.

One of the notable differences between Eastern and Western Arctic winter ice is the lack of a "tidal hinge" in the western region. Tides are quite minor in the Western Arctic, averaging from one to two feet on the open coast. In summer the height of the tide is influenced more by prevailing winds than any other factor. In the Eastern Arctic, high tides raise and lower the harbour ice, leaving a zone of weakened ice or open water between the main mass and the shore. In the Western Arctic, on the other hand, tides are so minor that the harbour ice freezes solidly to the shore. Its average thickness in late winter is five to seven feet.

In spring the ice breaks up first along the coasts, especially near the mouths of rivers. A strip of open water melts along the shore, and cracks appear in the harbour ice. Soon the cracks grow wider, and the floes are shifted about with the

REGIONS ARCTIQUES OCCIDENTALES DU CANADA

wind. Finally, a strong off-shore wind will move the ice out of the harbour into the shifting mass in the main channels. This harbour break-up occurs in the last half of June or early July along the mainland coast, but may be as late as the middle of July among the Western Arctic Islands.

Similarly, small lakes on the mainland begin to break up towards the end of June, and larger lakes are ice-free by the middle of July. On northern Victoria and Banks Islands, large lakes may still be frozen over early in August.

After the harbour ice has moved out there still remains a period of weeks before navigation is possible along the coasts. The open coast of Beaufort Sea near the Mackenzie River Delta and that south of Amundsen Gulf usually have a strip of open water along the shore by early August. At any time during the summer, however, strong northerly winds may push the heavy floes of Beaufort Sea southward against the coast. Westerly winds may block the harbours and inlets of western Victoria Island throughout July, and may jam Dolphin and Union Strait. In some years this latter Strait has been blocked with ice floes throughout the summer, but this barrier is not common.

By the end of July, Coronation Gulf usually has enough open water for navigation. The floes move about with the winds in the central part of the gulf until they melt. In shallow Queen Maud Gulf the ice remains until the latter part of August before melting away. At any time heavy polar ice from M'Clintock Channel may push southward through Victoria Strait and into Queen Maud Gulf. Simpson Strait, south of King William Island, is too narrow for polar ice to enter so that this strait and the straits to the eastward are open in August.

North of King William Island there is almost no ice-free season, or at best a period of only a few weeks around the first of September. Heavy polar ice from M'Clintock Channel pushes southward throughout the year, and having no outlet, jams into the passages of Victoria, James Ross and Franklin Straits. Only occasional navigation by shallow-draught vessels has been possible off the west coast of Boothia Peninsula, particularly when favourable winds hold the ice off the coast. Peel Channel apparently has pack ice throughout the year, but in some seasons it is loose enough to permit schooner navigation with difficulty.

North of Banks and Victoria Islands heavy polar ice from the Arctic Ocean packs the channels throughout the year and pushes against the coasts. It is possible that the ice loosens slightly by the end of August, but navigation will always be hazardous. Prince of Wales Strait, between Banks and Victoria Islands, has been reported open in late August in some years, and jammed full of floes in other years.

Summary.—The Western Arctic is a treeless region along the north-central and northwestern coast of the mainland of Canada and includes the nearby Arctic Islands. It is underlain chiefly by ancient worn Precambrian rocks on the mainland, whereas sedimentary rock predominates on the islands. Most coasts are characterized by old gravel and disintegrated rock beach-lines which indicate the emergence of the region from the sea since the last Glacial Age. Topography, often dependent on the underlying bedrock, is either rough and rugged in places, or low and flat. Most of the region, owing to the permanently frozen subsoil, is covered with innumerable lakes of all sizes and shapes.

The region has an Arctic climate, in which winters are continuously cold for five or six months, but do not record the extreme minima of the nearby Subarctic Mackenzie Valley. Summers are cool and short in the Western Arctic. Afternoon

temperatures occasionally rise above 60°F., and no month has an average mean temperature above 50°F. Precipitation is low throughout the year. Rains fall in July and August, and snowfall is most frequent in October and November.

The seas and straits off the mainland and between the Arctic Islands are frozen over for about nine months of the year. The ice begins breaking up in July along the mainland, the exact time of break-up varying regionally and from season to season. The wide channels north of the Western Arctic Islands remain jammed throughout the year with heavy pack-ice from the Arctic Ocean.

Section 2.—Political Geography

Politically, Canada is divided into nine Provinces and two Territories. From east to west these are: the Maritime Provinces of Prince Edward Island, Nova Scotia and New Brunswick; Quebec; Ontario; the Prairie Provinces of Manitoba, Saskatchewan and Alberta; and the most westerly province, British Columbia. North of the area included in the provinces the country is divided into Yukon and the Northwest Territories. The political characteristics and the resources of each of these areas are reviewed at pp. 23-27 of the 1946 Year Book. Each of the provinces is sovereign in its own sphere, as set out in the British North America Act (The B.N.A. Act with amendments to date, appears at pp. 40-60 of the 1942 Year Book) and, as new provinces have been organized from the Federal lands of the Northwest, they have been granted political status equivalent to that of the original provinces. Yukon and the Northwest Territories with their boundaries of to-day are administered by the Federal Government.

PART II.—GEOLOGY

For the latest material published under this heading see the 1947 edition of the Year Book, pp. 19-29.

Further reference to earlier articles will be found at the front of this edition.

PART III.—GEOPHYSICS*

Section 1.—Gravity

Absolute and Relative Measurements of Gravity.—Determinations of gravity fall into two classes (a) absolute determinations (b) relative determinations. The latter are made by setting up an apparatus and taking observations with it at a base station (where gravity is known or assumed to be known) and at other stations where the value is required. Relative measurements which really determine only differences in gravity can be made with great accuracy because they do not necessitate the measurement or evaluation of certain quantities that are required in absolute determinations.

There are only very few places where absolute gravity measurements of the highest accuracy have been made; the best of these are probably The Geodetic Institute at Potsdam, Germany, the Bureau of Standards at Washington, U.S.A., and the National Physical Laboratory at Teddington, near London, England. Such measurements have all been made by determination of the time of vibration

* Prepared under the direction of W. B. Timm, C.B.E., Director, Mines, Forests and Scientific Services Branch, Department of Mines and Resources, Ottawa.

of a pendulum the square of which is inversely proportional to gravity. All or nearly all other measurements of gravity are referred to these locations and all relative determinations in North America are referred to one of them.

Observations extended over lengthy intervals at each place: at Potsdam between 1898 and 1904; by Kühnen and Furtwangler, at Washington between 1933 and 1935; by Heyl and Cook, and at Teddington, near London, by Clark, between 1936 and 1939. These three places have been compared by relative measurements with pendulums which show that the previously accepted value for Potsdam, to which all relative measurements in North America are referred, is in error by 17 milligals in terms of the commonly accepted unit of one milligal equals 0.001 centimetre per second, per second. Although there is a slight difference depending on how the relative measurements are interpreted, Heyl's determination suggests a correction of 20 milligals to Kühnen's value and Clark's result gives a correction of 15 milligals, the mean of the two being 17 milligals. This is the correction (it is negative) recommended by the sub-committee on gravity of the National Research Council of the United States in 1942.

Dryden, who, in 1942, made a re-examination of the Potsdam determination considers that an unwarranted correction was made by the Potsdam observers to account for certain systematic errors. If this correction had not been made Dryden argues that the Potsdam result would have been 12 milligals less and, in order to obtain the most probable absolute values for stations expressed in terms of the Potsdam system, he would subtract 15 milligals.

The absolute measures at Washington appear correct to better than 10 milligals. They may be subject as has been the experience in the past with pendulum results, to some unsuspected systematic error. An accurate absolute determination of gravity by some method other than pendulums is most desirable.

The first serious attempt in Canada to measure gravity appears to have been an absolute measurement by A. M. Scott in the School of Practical Science of the University of Toronto, Ont., in 1896. Observations were made with a Kater's pendulum constructed of steel and manufactured by Nalder Brothers of London, England. Observations and investigations in connection with the determination extended over a period of three months or more. Mr. Scott, who was then an undergraduate in Arts, presented the results of his work and a valuable thesis on the pendulum in competition for the 1851 Science Scholarship. He obtained 980.304 centimetres per second, per second, or 32.3590 feet per second, per second, for the acceleration due to gravity or in other words for the increase in velocity acquired in one second by a freely falling body at Toronto. The most direct way to determine gravity, but apparently not the most accurate, would be to measure this increment in velocity directly.

Scott estimated the probable error of his determination at about one part in one hundred thousand or 0.01 cm. per second, per second. Recent observations on the campus of the University with a gravimeter indicate that Scott's value is in error by about 140 milligals which compares rather unfavourably with an accuracy of 50 milligals obtained by Kater in an absolute determination in London, in 1818. Employing an invariable pendulum, Kater made a number of relative determinations between the Isle of Wight and the Orkneys with an accuracy of from 2 to 3 milligals equal to or better than that frequently obtained in recent years with invariable pendulums.

The greatest accuracy normally obtained in relative determinations with pendulums appears to have been with an apparatus developed by the Gulf Oil Corporation in the United States for which an accuracy of 1 in 4,000,000 in routine field operations is claimed. In this routine, three to five stations were occupied in one day with two sets of apparatus and a crew of 25 men including surveyors to determine locations and elevations of stations.

The first relative determination of gravity in Canada was made with reference to Paris by Commandant Defforges of the Service Geographique of the French Army in the basement of the Macdonald Physics building of McGill University, Montreal, Que., in 1893. Other determinations were made by him the same year at Montreal, Que., and at Washington, Chicago, Denver, Salt Lake City, Mount Hamilton and San Francisco, U.S.A. A defect of gravity (now known to be due to isostatic compensation) according to the Bouguer theoretical method of computing gravity had already been observed over the Continents of Europe, Africa and Asia. Observations were made at the previously mentioned places to determine whether the same condition prevailed in North America. The results indicated a deficiency of gravity over the continent reaching a maximum of over 200 milligals at Salt Lake City, thus confirming what had been previously discovered on the other continents.

Gravity Work of the Dominion Observatory.—Observations of gravity were begun by the Dominion Observatory, in 1902, when a pendulum apparatus constructed by Saegmuller under the supervision of the United States Coast and Geodetic Survey was purchased in Washington. Dr. O. J. Klotz took observations with it that year at Washington, U.S.A., Ottawa, Ont., Toronto, Ont., and at Montreal, Que., and in connection with the determination of Trans-Pacific longitudes in 1903, also observed at Suva, Fiji, and Doubtless Bay, New Zealand. In connection with the observation of the total eclipse of the sun on Aug. 30, 1905, a determination of gravity was made at Northwest River, Labrador, by Professor Louis B. Stewart of the University of Toronto with the Dominion Observatory pendulum apparatus.

This apparatus consists of a set of three pendulums with the knife edge not on the pendulums but on a bracket which can be made fast in the pendulum case. The head of the pendulum has the form of an inverted stirrup with an agate plane in the head which rests upon the knife edge when the pendulum is in motion. Considerable trouble was experienced with the apparatus in the early days until the bobs were fastened securely to the stems by rivetting. A description of the instrument appears in Publication, Vol. II, No. 10, of the Dominion Observatory.

After Professor Stewart's observations in Labrador no further work was done until 1914 when F. A. McDiarmid made a comparison of gravity between Washington and Ottawa. He observed on the gravity pier in the Dominion Observatory which since that time has remained the base to which all gravity determinations by the Dominion Observatory are referred. With reference to the former base station of the United States Coast and Geodetic Survey at 205 New Jersey Avenue, S.E., Washington, and the value 980.118 cm., per sec., per sec., for it, McDiarmid obtained 980.621 cm. per sec., per sec., for Ottawa. For the same comparison, in 1921, A. H. Miller obtained 980.624 cm. per sec., per sec., and in 1929 the value 980.622 cm. per sec., per sec., for Ottawa. Until 1928, Washington was the only station in North America that had a trustworthy connection with Potsdam. By direct connection with Potsdam, in 1900, by Putnam, and following a world adjustment

by Borass, the value 980·112 cm. per sec., per sec., was adopted for the New Jersey Avenue Base. Observations at Washington by Meinesz and Miller, in 1928 and 1929, suggested that this value was a few milligals too low. Due to its importance as a reference point and in order to remove doubt, the Coast and Geodetic Survey made a direct connection between Washington and Potsdam by Lieutenant Edwin J. Brown of the staff of the Survey in 1932 and 1933. By this time the New Jersey Avenue Base had been destroyed by building operations. It had, however, been connected in 1893 with the first gravity base station in Washington in the Smithsonian Institution. In April and May, 1932, a connection was made between the Smithsonian base and the new base station established in the new Department of Commerce building on Constitution Avenue, Washington, D.C. Brown adopted 980·118 cm. per sec., per sec., for the new commerce base the mean of his own observations and those of Miller's reduced to the new base. The two sets by the separate observers, agreed within one-tenth of a milligal for the bronze pendulums employed by both observers. The invar pendulums used only by Brown, gave a discordant result differing by 3 milligals.

Although it is not made expressly clear in Brown's report, it appears that the adopted value 980·118 cm. per sec., per sec., for the new Commerce base, implies 980·117 cm. per sec., per sec., for the New Jersey Avenue base at which observations have been made by the Dominion Observatory, Ottawa.

During 1928 and 1929, a careful comparison was made by the Dominion Observatory between Ottawa, Greenwich, Potsdam and the New Jersey Avenue base in Washington. Three pendulums and two knife edges were used. Assuming the value for Potsdam, six individual values were obtained for each of the other places. The average departure of the mean from the six individual values for Greenwich was 1 milligal, for Washington, 1 milligal and for Ottawa, 2 milligals. The value 980·622 cm. per sec., per sec., has been adopted for Ottawa, with reference to Potsdam. The most probable absolute value for Ottawa is 980·605 cm. per sec., per sec.

Forty-two stations were established across Canada between Halifax, N.S., and Vancouver, B.C., with the pendulum apparatus in 1914 and 1915. Since then, the number of pendulum stations observed in Canada has increased to a total of 186. Most of them are in the southern part of the country but 10 stations have been observed in the Northwest Territories north of 60°. The most northerly station, at present, is Cambridge Bay latitude 69° 07·4 N. and longitude 105° 04·1 W. A combined airborne gravity and magnetic expedition established seven stations, including that at Cambridge Bay in the Northwest Territories, in 1945.

The results of these gravity observations are of value as reference points to commercial concerns engaged in exploration by the gravity method. They are of great value in determining the shape of the earth and the form of the geoid or level surface of the earth. The results of the observations have been used to investigate the nature of the earth's outer and lighter crust in Canada. These studies suggest that the crust varies in thickness from 35 kilometres along the coasts and less elevated regions to about 50 kilometres or more in the mountains of British Columbia. The crust rests upon a lower and denser layer in a condition of isostatic equilibrium somewhat akin to that of an iceberg in the sea, except that the lower layer is not fluid like water, but yields to long continued stress. It is apparent though, that the layer beneath the outer crust possesses some strength even over long periods of

time for there are extensive areas in both Canada and the United States where isostatic gravity anomalies of 20 milligals or even more prevail, representing unbalanced loads of rock of 500 feet or more in thickness.

At a considerable number of pendulum stations in the glaciated regions of the Canadian Shield the isostatic anomalies are negative, suggesting, possibly, that the crust of the earth depressed by the ice may not have regained its pre-glacial elevation.

Investigations of Geophysical Methods of Prospecting.—An exceedingly sensitive gravity apparatus is the Eötvös torsion balance. This instrument, unlike the pendulum or the gravimeter, does not measure, directly, either gravity or gravity differences. It does measure the rate of change of gravity or gradient of gravity in the level or horizontal surface and also the differential curvature of the level surface with extraordinary accuracy. Differences of gravity may be obtained by setting up at two or more points. Gravity gradients can be measured to an accuracy of one Eötvös unit corresponding to a rate of change of gravity which, over a distance of one mile, would represent a variation of gravity of one-sixth of a milligal. The instrument has been displaced but not entirely supplanted, by the gravimeter.

For several years the Observatory carried on investigations and tests in collaboration with the Geological Survey of Canada and other institutions, with torsion balances and magnetometers over certain geological structures and ore deposits with quite favourable results in several cases. Reports on the work appear in publications of the Dominion Observatory and elsewhere.

Investigations with Gravimeters.—With the development of the modern gravimeter and particularly with the development of these instruments in the United States during the latest decade, extraordinary progress has been made in the investigation of the earth's crust by the gravity method. Many thousand determinations have been made in the United States and Canada in the search for oil and other minerals. Gravimeters are in principle exceedingly delicate weighing machines capable of measuring gravity differences to one-hundredth of a milligal which is one one-hundred millionth part of gravity, although the instrument, like the invariable pendulum, does not really measure gravity itself. Up to 100 determinations can be made in a restricted area with the gravimeter in a day. Deposits or formations of light or heavy rock can, therefore, be rapidly outlined with them.

In the summer of 1944, the Humble Oil and Refining Company of Houston, Texas, through the courtesy of the American Geophysical Union, placed a gravimeter at the disposal of the Dominion Observatory. In collaboration with the Geological Survey of Canada and the Department of Lands and Mines of the Province of New Brunswick during that season several hundred observations were made with this gravimeter in Eastern Canada and particularly over the carboniferous basin of central New Brunswick where indication of the location of buried pre-carboniferous ridges was sought. Evidence of these ridges was discovered at several places. Further observations, in 1945, by the Dominion Observatory, brought the number of observations with the instrument up to over 1,000 and showed that granite batholiths in the Maritimes are definitely associated with negative anomalies and that the Caledonia Mountain region of New Brunswick and the Cobequid Mountains of Nova Scotia, in which igneous rocks and altered sediments of Precambrian and Palaeozoic age are prevalent, are both areas of positive gravity anomaly.

A Mott Smith gravimeter was purchased by the Observatory from the Atlas Corporation of Houston, Texas, in 1946. Over 1,600 observations have since been made with it across Canada between Amherst, N.S., and Jasper, Alta. A network of gravity and magnetometric stations was established in the mining areas of northern Ontario and western Quebec in 1947 and pronounced anomalies related to the geology were observed. It is believed that study of the results will lead to better understanding of the correlation between the anomalies and the geology. Observations over the Prairies suggest the existence and indicate the location of buried formations underlying the soil, clay and gravel.

During 1947, a party in charge of M. J. S. Innes, of the staff of the Dominion Observatory, operated in an area in northern Canada almost entirely within the Canadian Shield observing gravity and vertical magnetic intensity. A gravimeter was hired from the North American Geophysical Company of Houston, Texas for this work. Traverses were made along the northern railways leading to Hudson and James Bays. A test of the applicability of gravity and magnetic methods to the location and delineation of mineral deposits was made by Mr. Innes by observation of 220 stations over the East Sullivan sulphide ore body at Val d'Or, Que. Two hundred and thirteen stations were established by Mr. Innes' party in six weeks during July and part of August in northwestern Ontario, northern Manitoba and Saskatchewan between latitudes 50° and 58° N. and longitudes 92° and 108° W. covering an area of 185,000 sq. miles within the Canadian Shield. An aeroplane was employed for transportation in this work.

Section 2.—Seismology

That branch of science which treats of earthquakes has received considerable attention in Canada during recent years. It has been generally recognized that earthquakes are frequent in regions of adjustment of strata and are characteristic of the newer mountain and coastal regions where steep level-gradients occur. The energy radiated from an earthquake in the form of elastic waves in the earth is, however, recorded on sensitive seismographs up to great distances, even to the antipodes of the earthquake. Seismological researches, while regularly recording the routine statistical data regarding earthquakes, seek also to determine particular causes. Moreover, they endeavour to ascertain the physical properties of the earth's crust and interior as revealed by the peculiarities on the "time-distance curves" for earthquakes.

A time-distance curve, as its name implies, shows the relation between the areal surface distances from the origin of the earthquake to the various recording stations and the elapsed time required for the initial impulses and their various reflections from layers in the earth to reach each station from the origin concerned. Of late years, these time-distance curves have been greatly improved. Further improvement of these curves must be through taking account of the depth of the origin—the "focal depth". The point within the earth from which energy of an earthquake is liberated is called the "focus"; the point vertically above the focus, on the surface, the "epicentre".

The records of seismograph stations within 500 miles of an earthquake are used to determine the epicentre, focal depth, and focal time. Those same stations, together with the others at distances up to the antipodes of an earthquake, are used to determine arrival times for making up the time-distance curves. The curves themselves are the point of departure for a study of the earth's crust and deep interior.

For a complete history of seismology in Canada, see pp. 7-9 of the 1943-44 edition of the Year Book.

There are at present, six permanent seismograph stations located in Canada. The control station is at the Dominion Observatory in Ottawa, Ont. There are stations operated by Dalhousie University at Halifax, N.S., by the University of Saskatchewan at Saskatoon, Sask., by the Dominion Astrophysical Observatory at Victoria, B.C., and by the Shawinigan Water and Power Company at Shawinigan Falls and Seven Falls, Que. All of these stations send their seismograms to Ottawa for study. From these records all the earthquakes recorded are listed and monthly bulletins are forwarded to most of the seismograph stations of the world. Those earthquakes which are called "local", that is they originate in this eastern part of North America, are reported to a central station at Boston, Mass., to be included in a special monthly bulletin. Any strong shock within Canadian borders is investigated and its place of origin is definitely located both by field study and by a mathematical solution from the seismograms available. In this regard, detailed studies have been made of the St. Lawrence earthquake of 1925, the Grand Banks earthquake of 1929, the Temiskaming earthquake of 1935, the Cornwall-Massena earthquake of 1944, and the British Columbia earthquake of 1946. In the case of the last two the mathematical solution of the epicentre from seismograms is now proceeding.

In order that the crustal structure of the Canadian Shield may be thoroughly studied a new program has been organized. From time to time, some of the mines at Kirkland Lake, Ont., suffer what is known as a rockburst. Some of these bursts have sufficient energy to record on seismographs up to 500 or 600 miles. These bursts, besides giving a record similar to that of an earthquake, have the feature that their exact location and depth are known. So that if seismograph stations are established, one at the mine to record the time of the burst, and several others along a line, a time-distance curve may be drawn up on which both time and distance are accurately known. From this curve and some mathematical calculation the depths of the various layers in the earth beneath the area studied are known. For this purpose a permanent seismograph station at Kirkland Lake has been established, and two other stations are operating on a semi-permanent basis between Ottawa and Kirkland Lake. This program promises to yield valuable scientific data for the future study of earthquakes in the area of the Canadian Shield and to give an accurate picture of the earth structure immediately beneath.

A modified form of seismograph is used for seismic prospecting. Dynamite is detonated in specially drilled holes and the resulting shock waves are recorded on seismographs at measured distances. A study made of the records obtained yields information which leads to the location of subsurface structures including those likely to contain oil or natural gas. Such work is being done more and more in the oil fields in southern Alberta and is responsible in some part for the recent discovery of new productive areas. The Dominion Observatory has had an observer attached to several of these surveys and at all times the seismologists endeavour to keep posted on the developments in this application of seismology.

The Seismological Service of Canada co-operates with seismograph stations from all parts of the world in supplying data and records for study of various earthquakes and, in return, co-operation is obtained from them in the obtaining of data for large Canadian earthquakes. The Bibliography of Seismology, a bi-annual publication of the Dominion Observatory listing all the articles on the subject for ready reference, is distributed to seismologists in every country.

Section 3.—Terrestrial Magnetism

The study of the magnetic phenomena of the earth is of paramount importance in the field of geophysics. The cause and origin of the earth's magnetic field are not fully known and in this regard it has something in common with that other great natural phenomenon, gravitation.

The magnetic field is not confined within the earth. It extends far out into space and at a height of 4,000 miles is still one-eighth as great as at the surface. The magnetic field is being constantly affected and deformed by effects of the sun, moon and radiations from space. It is subject to changes both in direction and magnitude. There is a slow progressive change throughout the years known as secular variation. There are orderly daily changes varying in magnitude and character with geographic position, with the seasons and with cycles of disturbances on the sun. There are also short-period and sudden commencement disturbances known as magnetic storms which apparently are linked up with solar disturbance and other cosmical phenomena. Great magnetic storms are usually accompanied by brilliant auroral displays.

Although the earth's magnetic field is not apparent to the senses, it can be measured with facility. There are three magnetic elements whose values must be known to supply a complete knowledge of the magnetic field at any place. These are the declination, inclination and intensity. The declination, sometimes called variation of the compass, is measured in the horizontal plane and represents the angular distance between the true and magnetic meridians. The inclination or dip is measured in the vertical plane and represents the angular distance between the direction of the magnetic field and the horizon. The intensity, if measured in the plane of inclination, is known as total intensity but if measured in the horizontal or vertical plane is known as horizontal or vertical intensity.

Probably the most practical use made of the earth's magnetic field has been in surveying and in navigation by water and air. The magnetic compass was used in early survey work in Canada to delineate the boundaries of parcels of land. Its importance to navigation is universally recognized. Another important practical use, now probably ranking equal to that of navigation, occurs in mapping magnetic anomalies caused by bodies of magnetic ore. Magnetic methods and techniques in geophysical prospecting for ore and favourable locations for oil are being employed more and more extensively. The science of terrestrial magnetism plays an important part in the study of highly penetrating radiation known as cosmic rays, in the study of currents of electricity in the earth which frequently interrupt telegraphic communications by land line and cable, and related electrical phenomena in the air which have an important effect on the transmission and reception of radio waves.

The development of the science of terrestrial magnetism in Canada closely parallels the development of the country. Magnetic observations were made at Halifax, N.S., by Champlain in 1604. Observations at Quebec date back to 1642 and at Montreal to 1700. Owing to the voyages of the Hudson's Bay Company into Hudson Bay, magnetic observations were made as early as 1668 at Fort Albany and 1725 at York Factory. Captain Cook observed at Nootka, Vancouver Island, in 1778. Observations in Northern Canada and the Canadian Arctic were commenced in 1818 and continued for an entire century by such explorers and scientists as Parry, Franklin, Sabine, Ross, Lefroy, Greely, Amundsen and Stefansson. Although the magnetic investigations accomplished by many Arctic explorers have

equal rank, particular reference may be made to those of Ross, 1829-31, whereby he located the position of the North Magnetic Pole on the western coast of Boothia Peninsula at Cape Adelaide and those of Amundsen, 1903-05, which confirmed the general location of Ross's pole.

In 1880, the Topographical Survey Branch of the then Department of the Interior began to gather magnetic information chiefly pertaining to declination. The determination of the magnetic elements was an adjunct to the regular survey work of the Topographical Survey and being designed for immediate practical use did not always possess the degree of accuracy required for a mathematical discussion of the problem of the earth's magnetism. The Carnegie Institution of Washington, D.C., therefore, began sending scientific magnetic survey parties into Canada in 1905. These parties were withdrawn in 1913.

The Dominion Observatory, in 1907, recognized the importance to Canada of the science of terrestrial magnetism and instituted a systematic scientific magnetic survey of the country using instruments of the design approved by scientists of international renown. Since that time, the Observatory has established a network of base magnetic stations extending from Cape Race, Newfoundland, to Triangle Island, off the northwest tip of Vancouver Island, and from the Canada-United States boundary in the south to latitude 80° N. in Ellesmere Island. Over 1,200 magnetic stations have been established and at approximately 400 of these observations are repeated at roughly five-year intervals in order to record the secular change in the magnetic elements. In addition, several hundred declination stations have been occupied in Northern Canada during recent years by the Geodetic and Topographical Surveys.

The Dominion Observatory maintains at present, two permanent and one temporary magnetic observatories where continuous records are made of the changes in the earth's magnetic field.

The Toronto Magnetic Observatory began operations in September, 1840. The Observatory has been in continuous operation ever since and it is and has been one of the principal magnetic observatories of the world. In 1898, owing to the artificial disturbances due to electric streetcars in Toronto, Ont., the Observatory was moved 12 miles distant to Agincourt, Ont., where it still is in operation. Meanook Magnetic Observatory, about 90 miles north of Edmonton, Alta., was established in 1916. This Observatory has become invaluable in furnishing control to field observations made in Northern Canada. A temporary magnetic observatory was established at Baker Lake, N.W.T., in December, 1947, for the purpose of studying Sub-Arctic magnetic phenomena. The observatories at Agincourt and Meanook were operated by the Meteorological Service until December, 1936, when they were transferred to the Dominion Observatory. It should be noted that temporary magnetic observatories operated in 1882-83 at Fort Rae, near North Arm of Great Slave Lake, at Kingua Fiord, near Pangnirtung, Baffin Island and at Fort Conger in north Ellesmere Island. Fifty years later, in 1932-33, magnetic observatories were operated at Fort Rae and Chesterfield Inlet. In both these epochs the observatories were part of an international network established to study the earth's magnetic field in Polar regions.

The Dominion Observatory has given particular attention in recent years to the collection and subsequent analyses of magnetic data from the Canadian Arctic. Such information is essential to the construction of accurate and complete air navigation charts. A very interesting and important contribution to the science

of Terrestrial Magnetism relative to the position of the North Magnetic Pole is now possible as a result of the extension of the network of ground magnetic stations in the Arctic Islands. It is now definitely established that the North Magnetic Pole is no longer in Boothia Peninsula but has moved to a location near the northern part of Prince of Wales Island.

The magnetic data gathered by the Dominion Observatory is used in the mathematical analysis of the cause and effects of the earth's magnetism and in the construction of all magnetic charts of Canada for use of air and marine navigators, surveyors and prospectors. Base magnetic stations have been established in many of the important mining areas for which absolute values of the magnetic elements for any time can be supplied to geophysical prospectors. The magnetograms from the magnetic observatories afford measurements of disturbances which must be taken into account in the interpretation of magnetic surveys made in mining areas.

The necessity of more accurate and sensitive magnetic instruments required to undertake specific and highly specialized investigations has not been overlooked by the Division of Terrestrial Magnetism of the Dominion Observatory. An induction type universal magnetometer was designed and constructed in 1947. This instrument was severely tested in the environs of the North Magnetic Pole where it performed satisfactorily when the standard type magnetometer was useless.

It is expected that increasing use will be found in the future for instruments of this type and for certain purposes they may largely displace the older instruments

Airborne Magnetometers in Canada.—An important development in the field of Terrestrial Magnetism was made during the Second World War when instruments were devised for the measurement of total magnetic force from the air. While the original purpose of these devices was the detection of submarines they have since found useful application in magnetic surveying particularly in its application to geology.

The first use in Canada of an airborne magnetometer was initiated by the Geological Survey of Canada, when a trial demonstration in the vicinity of Ottawa, Ont., was made by officials of the United States Geological Survey in September, 1946. Partly as a result of this demonstration, development work in Canada carried out jointly by the National Research Council and the Geological Survey was brought to the point where a trial area of 3,000 square miles in the vicinity of Ottawa was surveyed during the latter part of 1947. Following the initial successful trials it is expected that the airborne magnetometer will be extensively used in the future as an adjunct to geological mapping and to assist in the discovery and interpretation of geological structures where more conventional methods have proved to be inadequate.

Similar types of airborne magnetometers were first used by commercial companies in 1947. During the year large areas have been surveyed in northern Ontario, northern Manitoba and along the north shore of the St. Lawrence River in Quebec. In addition, a large area was surveyed in Alberta and several thousand square miles in northern Ontario and Quebec.

A second type of airborne magnetometer was developed during 1947 by Hans Lundberg Geophysics Company of Toronto, Ont. This instrument is of the earth inductor type and is carried in a helicopter rather than the conventional type aircraft and is, therefore, more suitable for surveying small areas.

PART IV.—FAUNA AND FLORA

See list at the front of this edition for special material, under this heading, published in previous editions of the Year Book.

PART V.—LANDS, PARKS, SCENIC AND GAME RESOURCES

Canada is a comparatively new country with resources that are, for the most part, in the early stages of development. The fur, fishery and forest resources have, it is true, been the basis of trade for two or three hundred years, but exploitation on the present commercial scale is of relatively recent growth. Nevertheless, much effort has been directed to conservation in the cases of those resources that admit of such methods. Details of such policy are given in the chapters dealing with the individual resources.

Numerous surveys and investigations of the extent and value of the resources have been made from time to time and the results have been reviewed in special publications. Detailed information regarding individual natural resources will be found in the later chapters.

Section 1.—Lands Resources

1.—Land Area of Canada, Classified as Agricultural, Forested or Unproductive

NOTE.—The land area of Canada is shown classified by tenure in Chapter XXX.

Description	Prince Edward Island	Nova Scotia	New Brunswick	Quebec	Ontario	Manitoba
	sq. miles	sq. miles	sq. miles	sq. miles	sq. miles	sq. miles
Agricultural Land (Present and Potential)—

Young growth.....	23,890	16,880	2	11,200	81,380
Total Productive Forested Land.....	46,060	93,060	85,890	47,000	813,110
Unproductive Forested Land.....	40,000	37,560	128,560	76,000	477,850
Tenure—Privately owned.....	10,257	10,004	7,386	Nil	100,175
Crown land.....	75,803	120,616	207,064	123,000	1,190,785
Totals, Forested Land.....	86,060	130,620	214,450	123,000	1,290,960
Net Productive Land³.....	184,130	217,999	222,116	133,069	1,593,179
Waste and Other Land⁴.....	53,845	30,801	137,163	1,325,715	1,868,924
Totals, Land Area.....	237,975	248,850	359,279	1,458,784	3,462,103

¹ These totals embrace present agricultural land of all possible classes and land that has agricultural possibilities in any sense. ² Very small or negligible. ³ Total agricultural land plus forested land minus forested agricultural land. ⁴ Includes open muskeg, rock, road allowances, urban land, etc.

⁵ The figures given are strictly estimates but are the best available until definite data are obtainable. ⁶ Includes 4 sq. miles of occupied land in Yukon and the Northwest Territories.

⁷ An estimate from provincial sources places the total area of land suitable for tillage at 6,626 sq. miles.

The figures of Table 1 are based on estimates from the Decennial Census of 1941 in regard to agricultural lands, the Dominion Forest Service as regards forested lands, and from the Surveyor General and Chief of the Surveys and Engineering Branch as regards total land areas of Canada and of the Provinces; they show how the land area is classified as between present and potential agricultural lands, present and potential forested lands, and lands that are unproductive as regards surface resources. Between the totals of present and potential agricultural lands and the totals of forested lands there is, of course, duplication to the extent of the agricultural lands under forest.

Section 2.—Parks and Other Areas under the Federal District Commission

The Federal District Commission, known as the Ottawa Improvement Commission previous to 1927, was established by Parliament in 1899 for the beautification and improvement of the city of Ottawa, Canada's Capital, by the construction and maintenance of parks and driveways.

In 1927, with the change in name, the scope of the Commission's operations was widened to include the adjoining districts, and its membership increased from eight to ten, including a representative of the city of Hull, Que. Subsequently the Commission was given the additional responsibility of maintaining the grounds of all Federal Government Buildings in Ottawa and vicinity.

Departments of the Federal Government from time to time ask the Commission to carry out improvements to the grounds of newly-constructed Government buildings on the basis of full reimbursement for the actual costs entailed. The Commission has the trained personnel and the special equipment required for such work.

Funds for the purposes of the Commission are provided by statutory grants and votes of Parliament.

By amendment to the Federal District Commission Act, 1946, the membership of the Commission was increased to nineteen, thus providing for a more national character in its composition by the provision for inclusion therein of a representative from each of the provinces of Canada.

In the cities of Ottawa and Hull and immediate environs, eighteen parks have been developed and, in addition, the large and beautiful area known as Gatineau Park, described under a separate heading below, has been established in the Laurentian Hills. Twenty-two miles of landscaped driveways have been built and are being maintained.

Details of parkland owned or controlled by the Commission are as follows:

Owned in Ottawa, Hull, and in immediate vicinity of these two cities (Undeveloped—1,017 acres).....	1,325 acres
Leased from the Crown (Undeveloped—32 acres).....	224 "
Leased from the city of Ottawa and maintained by the Commission.....	129 "
Total Forwarded.....	1,678 "
Grounds of Federal Government buildings maintained by the Commission.....	200 "
Total.....	1,878 "
Less undeveloped.....	1,049 "
Total Developed as Parks and Parkland.....	829 "

The National Capital Planning Committee, appointed by the Federal District Commission is presently engaged, in co-operation with an eminent landscape architect and town planner, in preparing a master plan for the further improvement and beautification of the National Capital District, as a memorial to Canadians who made the supreme sacrifice in the Second World War.

Gatineau Park.—Gatineau Park differs from the other National Parks by being under the administration and control of the Federal District Commission. The Park is situated in the Province of Quebec about 8 air miles from the Federal Capital. It comprises at present about 22,000 acres of wooded hills, valleys, lakes and streams located in the southerly fringe of the Laurentians, the oldest mountains in Canada, and is being preserved in its natural state for the enjoyment of the public.

The Park is a game sanctuary. Deer, bear, fox, beaver, mink, raccoon and other fur-bearing animals are quite numerous. Well-located trails, picnic spots and camping sites afford the maximum of pleasure and healthful recreation for the many thousands who patronize this beautiful natural park located at the very

doorstep of Canada's capital city. Gatineau Park furnishes excellent opportunities for the enjoyment of skiing and is the principal centre in the Ottawa district for this popular winter sport.

In the further development of this Park, it is expected that its area will be increased to 50,000 acres, that overnight cabins will be provided and that administration buildings, shelters, refectories, bath-houses and other essential structures will be added.

The Park is administered by a Superintendent and a force of five rangers who act also as game wardens, police constables and fire guards.

Section 3.—National and Provincial Parks

National Parks of Canada.*—The Federal Government maintains the National Parks of Canada as a means of preserving regions of outstanding natural beauty or marked interest. The parks are dedicated to the people of Canada for their benefit, education and enjoyment, for which they provide remarkable opportunities. Differing widely in character and varying in purpose, the park areas include: the scenic and recreational parks situated from the Rocky and Selkirk Mountains to the Atlantic Coast; the national wild-animal parks—areas established for the protection and propagation of species once in danger of extinction; and the national historic parks. The administration of the parks is directed by the National Parks Service of the Lands and Development Services Branch, Department of Mines and Resources, Ottawa. Maintenance of the park areas is carried out by the respective Park Superintendents and their staffs, and major developments by the Engineering Service. Also under the supervision of the National Parks Service are the historic sites of national interest that have been acquired throughout the country. (See pp. 78-90 of the 1938 Year Book.)

In the national parks all wildlife is rigidly protected, and, as far as possible, primal natural conditions are maintained. Biological conditions in park waters are under constant scientific supervision, and modern management procedures, including stocking and transfer of game fish, used to maintain or improve angling. Opportunities for outdoor life and recreation have been increased by the provision of equipped camp-grounds, bath-houses and playgrounds, as well as golf courses, tennis courts, hot mineral-spring swimming pools, and winter sports facilities. Accommodation is provided in many of the parks by modern hotels, bungalow cabins, and chalets operated by private enterprise. Rail, air and highway transportation systems serve the parks, and within the parks nearly 700 miles of highways and 2,500 miles of trails have been built to provide access to outstanding scenic regions. To assist in forest conservation and other aspects of park administration 1,188 miles of telephone lines have been constructed. A number of these lines link fire lookout towers and wardens' cabins with park headquarters, and in some of the parks two-way radio equipment is used to maintain communication between headquarters and actual fire-fighting operations.

Scenic and Recreational Parks.—The scenic and recreational parks include regions of superb beauty and grandeur in the Rocky and Selkirk Mountains of Western Canada. Among these are: in Alberta, Banff, Jasper, and Waterton Lakes National Parks, on the eastern slope of the Rockies; and in British Columbia, Kootenay and Yoho, on the western slope of the Rockies; Glacier and Mount

* Prepared under the direction of R. A. Gibson, Director, Lands and Development Services Branch, Department of Mines and Resources, Ottawa.

Revelstoke National Parks in the Selkirks. While these parks bear a general resemblance to one another, each possesses individual characteristics and phenomena, varying fauna and flora, and distinct types of scenery. Banff and Jasper Parks contain the famous holiday resorts Lake Louise, Banff and Jasper. Direct connection between these parks is provided by the Banff-Jasper Highway, one of the most scenic mountain highways in the world.

Eastwards from the mountains are Prince Albert National Park in Saskatchewan, a typical example of the forest and lake country bordering the northwestern plains region; and Riding Mountain National Park in Manitoba, a well-timbered area dotted with numerous lakes, at a general altitude of 2,000 feet above sea-level. In Ontario there are small parks established primarily as recreational areas. They are Point Pelee, Georgian Bay Islands, and St. Lawrence Islands National Parks.

In the Maritime Provinces, two remarkable areas have been established as National Parks. Cape Breton Highlands National Park, situated in the northern part of Cape Breton Island, N.S., has an area of 390 square miles. Its rugged and picturesque shore line, indented by numerous bays and coves, and its rolling mountainous interior provide a delightful setting reminiscent of Scotland. Girdled on its eastern, northern, and western sides by a modern highway called the Cabot Trail, and possessing such features as trails, beaches, tennis courts, and a golf links, the park offers many diversions to the visitor. Prince Edward Island National Park, containing an area of 7 square miles, extends a distance of about 25 miles along the northern shore of the island province. Its chief attractions are magnificent sand beaches which invite ocean bathing under ideal conditions. The park also contains "Green Gables", the farmhouse made famous by the novels of L. M. Montgomery. Well maintained golf links, tennis courts, camp-grounds and marine drives enhance its attractions.

A new National Park is now being established in New Brunswick. Title to an area of nearly 80 square miles is being provided by the Provincial Government, and development of the new area is taking place, including the provision of facilities for tourist accommodation and recreation. The park is situated mainly in Albert County and lies between the Goose and Upper Salmon (Alma) Rivers. It extends northward from the Bay of Fundy for a distance of about nine miles.

Wild Animal Parks.—While all of the National Parks are wild animal sanctuaries, two are maintained, primarily, for the protection of big game species such as buffalo, elk, moose and other deer. These are Elk Island National Park in Alberta, 30 miles from Edmonton, a fenced area containing more than 1,000 head of buffalo as well as large herds of elk, moose, and mule deer; and Wood Buffalo Park, an immense region of forests and open plains extending on each side of the boundary between Alberta and the Northwest Territories and containing a large herd of buffalo and other species of wildlife.

National Historic Parks and Sites.—Canada has nine National Historic Parks. All but one of these Parks are in Eastern Canada, and they preserve places of great historic interest in the early development of this continent. Three of these Parks are in the Province of Nova Scotia—Port Royal Habitation at Lower Granville on the Annapolis Basin; Fort Anne nearby; and the Fortress of Louisbourg on Cape Breton Island; Fort Beausejour is on the Isthmus of Chignecto in the Province of New Brunswick. In the Province of Quebec are Fort Lennox on Ile-aux-Noix in the Richelieu River and Fort Chambly, also on the Richelieu, at Chambly Canton.

Fort Wellington, overlooking the St. Lawrence at Prescott, and Fort Malden, at Amherstburg, are in the Province of Ontario; and lastly, Fort Prince of Wales, near Churchill, in Manitoba, is the most northerly fortress on the North American Continent.

The National Parks Service is also charged with the preservation, restoration and marking of historic sites throughout Canada. In the work of acquiring and selecting sites worthy of commemoration, the Service has the assistance of the Historic Sites and Monuments Board of Canada, a group of recognized authorities on the history of the section of the country they represent. Of the total number of sites that have been considered by the Board, 337 have been suitably marked by the Department of Mines and Resources and 216 other sites recommended for future attention.

2.—Locations, Years Established, Areas and Characteristics of the National Parks

Park	Location	Year Estab- lished	Area	Characteristics
			sq. miles	
Scenic and Recreational Parks				
Banff.....	Western Alberta, on east slope of Rockies.	1885	2,585-00	Mountain playground containing famous resorts, Banff and Lake Louise. Typical example of central Rockies, with massive ranges, ice-fields, alpine valleys, glacier-fed lakes and hot mineral springs. Big-game sanctuary. Recreations: climbing, motoring, riding, bathing, golf, tennis, fishing, skiing.
Yoho.....	Eastern British Columbia, on west slope of Rockies.	1886	507-00	Rugged scenery on western slope of Rockies. Contains wonderful Yoho Valley, with its numerous waterfalls; Kicking Horse Valley; Emerald, O'Hara, and Wapta Lakes; natural bridge. Alpine climbing centre.
Glacier.....	Southeastern British Columbia, on the summit of the Selkirk Range.	1886	521-00	Superb example of Selkirk Mountain region, with snow-capped peaks, glaciers, luxuriant forests, alpine flower-gardens, numerous big game. Illecillewaet and Asulkan Glaciers; Rogers Pass; and famed Macdonald tunnel.
Waterton Lakes.....	Southern Alberta, adjoining Glacier Park in Montana, U.S.A.	1895	204-00	Canadian section, Waterton-Glacier International Peace Park. Mountains noted for beauty of colouring; lovely lakes, picturesque trails, waterfalls. Recreations: motoring, riding, fishing, tennis, golf, camping.
Jasper.....	Western Alberta, on east slope of Rockies.	1907	4,200-00	Rich in historical associations. Immense region of majestic peaks, deep canyons, beautiful lakes, containing famous resort, Jasper. Also Miette Hot Springs, Maligne Lake, Mount Edith Cavell and Columbia Ice-field. Big-game sanctuary. Recreations: motoring, climbing, riding, bathing, fishing, golf, tennis, skiing.
Mount Revelstoke....	Southeastern British Columbia, on the west slope of Selkirks.	1914	100-00	Alpine plateau on summit of Mount Revelstoke, accessible by spectacular 18-mile drive from Revelstoke. Contains mountain lakes, alpine flora, camp-sites. Game sanctuary; winter sports centre.
St. Lawrence Islands.	In St. Lawrence River between Morrisburg and Kingston, Ont.	1914	190-00 (acres)	Mainland reservation and thirteen islands among "Thousand Islands". Recreational area; camping, fishing, bathing.

2.—Locations, Years Established, Areas and Characteristics of the National Parks

—continued

Park	Location	Year Estab- lished	Area	Characteristics
			sq. miles	
Scenic and Recrea- tional Parks—con.				
Point Pelee.....	Southern Ontario, on Lake Erie.	1918	6.04	Most southerly mainland point in Canada (41° 54' N.). Recreational area with unique flora and fine beaches. Resting place for many migratory birds. Bath- ing, camping.
Kootenay.....	Southeastern British Columbia, on the west slope of Rockies.	1920	543.00	Mountain park bordering Vermilion- Sinclair section of Banff-Windermere Highway. Contains Sinclair Canyon, Radium Hot Springs, Marble Canyon. Big-game sanctuary. Recreations: motoring, bathing, camping.
Prince Albert.....	Central Saskat- chewan, north of Prince Albert.	1927	1,496.00	Forested lakeland of northwestern Canada with extensive waterways and fine beaches. Interesting fauna; summer resort. Recreations: boating, bathing, fishing, camping, tennis, golf.
Riding Mountain....	Southwestern Mani- toba, west of Lake Winnipeg.	1929	1,148.08	Rolling woodland, with crystal lakes, on summit of Manitoba escarpment. Natu- ral home for big game, including elk, deer, moose. Summer resort. Recre- ations: bathing, boating, fishing, tennis, golf, camping.
Georgian Bay Islands	In Georgian Bay, north of Midland, Ont.	1929	5.37	Thirty islands in Georgian Bay. Recrea- tional and camping area, boating, bath- ing, fishing, on Beausoleil Island. Unique limestone formations and caves on Flowerpot Island.
Cape Breton High- lands.	Northern part of Cape Breton Is- land, N.S.	1936	390.00 (approx.)	Outstanding example of rugged coast line with mountain background. Remark- able views of Atlantic Ocean and Gulf of St. Lawrence visible from highway; Cabot Trail. Recreations: bathing, boating, golf, tennis, deep-sea fishing, camping.
Prince Edward Island.	North shore of Prince Edward Island.	1937	7.00	Strip 25 miles long on north shore. Recre- ational area with magnificent beaches. Contains famed "Green Gables" farm- stead. Recreations: bathing, boating, fishing, golf, bowling, camping.
Wild Animal Parks				
Elk Island.....	Central Alberta, near Lamont.	1913 (Re- served 1906)	75.20	Fenced reserve containing a large herd of plains buffalo; also numerous deer, elk and moose. Recreational area at Astotin Lake; camping, boating, bathing, tennis and golf.
Wood Buffalo ¹	Partly in Alberta (13,675 sq. miles) and partly in Northwest Terri- tories (3,625 sq. miles), west of Athabaska and Slave Rivers.	1922	17,300.00 (approx.)	Immense unfenced area of forests and open plains, dotted with lakes and coursed by numerous streams and rivers. Contains a large herd of buffalo, developed from the native "woodland" type and surplus plains buffalo from Buffalo National Park; also bear, beaver, caribou, deer, moose and waterfowl. Area as yet undeveloped.

¹ Administered by the Bureau of Northwest Territories and Yukon Affairs of the Lands and Development Services Branch, Department of Mines and Resources, Ottawa.

2.—Locations, Years Established, Areas and Characteristics of the National Parks
—concluded

Park	Location	Year Estab- lished	Area	Characteristics
			acres	
Historic Parks				
Fort Anne.....	Nova Scotia (Annapolis Royal).	1917	31	Site of early Acadian settlement of Port Royal. Contains well-preserved fortifications of earthworks type; also museum housing a fine historical library and numerous exhibits relating to early periods.
Fort Beauséjour.....	New Brunswick, near Sackville.	1926	80	Site of French fort erected in middle of 18th century. Renamed Fort Cumberland by British on capture in 1755; original name since restored. Contains museum with many exhibits relating to history of region.
Fortress of Louisbourg.	Cape Breton Island, N.S., 25 miles from Sydney.	1941	340	Old walled city and strategic military and naval station built by the French, 1720-40. Captured by the British in 1758, it was destroyed in 1760. A museum on the site contains interesting mementoes of historic past.
Port Royal.....	Lower Granville, N.S., 8 miles from Annapolis Royal.	1941	17	Reconstruction on the exact site of the Port Royal 'Habitation' erected by DeMonts and Champlain in 1605. The original group of buildings, which sheltered the first permanent European settlement in Canada, was destroyed in 1613.
Fort Chambly.....	Chambly Canton, Que.	1941	2.5	French fort first constructed in 1665 on Richelieu River. Rebuilt of stone in 1711, it figured in several wars. Contains a museum housing many interesting exhibits. A military cemetery outside walls of fort is included in park area.
Fort Lennox.....	Ile-aux-Noix, Que., near St. Johns.	1941	210	Military post constructed by British on site of early French fort, to command Richelieu River water route from south. Several well-preserved stone buildings together with the earthworks and moat remain.
Fort Wellington.....	Prescott, Ont.....	1941	8.5	Contains well-preserved earthworks, block-house and other buildings constructed by British as base for defence of communications between Kingston and Montreal. The block-house contains a small museum.
Fort Malden.....	Amherstburg, Ont..	1941	5	Situated on the banks of the Detroit River, the site of one of the principal frontier military posts in Upper Canada. A new museum building contains interesting exhibits of the region.
Fort Prince of Wales.	Northern Manitoba, near Churchill.	1941	50	Massive stone fort built 1733-71, to secure control of Hudson Bay for Hudson's Bay Company and England. The fort was captured and partially destroyed by a French force in 1782.

SUMMARY OF THE AREAS OF NATIONAL PARKS, BY PROVINCES

Province	Area	Province	Area
	sq. miles		sq. miles
Prince Edward Island.....	7.00	Saskatchewan.....	1,496.00
Nova Scotia.....	390.60	Alberta.....	20,739.20
New Brunswick.....	80.12	British Columbia.....	1,671.00
Quebec.....	0.33 ¹	Northwest Territories.....	3,625.00
Ontario.....	11.72		
Manitoba.....	1,149.04	Total.....	29,170.01

¹ Not including area of Gatineau Park, 25 sq. miles in extent (see pp. 30-31).

Provincial Parks.—In addition to the National Parks already described, most of the provinces have established Provincial Parks. These parks, as in the case of the National Parks, are areas of great scenic or other interest maintained for the benefit of present and future generations. The Provincial Parks are administered by the Provincial Governments concerned, and in most cases they have not yet reached the degree of development which marks the National Parks. Following are brief descriptions of the principal Provincial Parks, by provinces.

Maritime Provinces.—There are National Parks in Prince Edward Island and Nova Scotia, and many civic parks, but none in any of the Maritime Provinces which comes within the classification of Provincial Parks.

Quebec.—There are five Provincial Parks in this Province, located in distinctive areas which enables each to offer some special interest. Like those in the other provinces, they have been established in order to preserve natural beauty and to protect the fauna and flora.

Laurentides Park is an area located a short distance north of the city of Quebec, and has an altitude of about 3,000 feet. It is remarkable for its numerous lakes, tumultuous rivers and fine speckled trout. Moose, deer, black bears, wolves, and all the fur-bearing animals of the Province abound here but no hunting is permitted. There are two well-organized hotels and about twenty fishing camps. Mount Orford Park is located on Orford Mountain, with an altitude of 2,860 feet. The slope of the mountain makes it one of the best skiing tests in Canada, and it also has a picturesque nine-hole golf course. Gaspesian Park has a flora representative of an era prior to the Great Continental Glacier. The main object of this park is to preserve the last herds of caribou on the south shore of the St. Lawrence. Speckled trout abound in the lakes and rivers of the Park. The Mont Laurier-Senneterre Road, Fish and Game Reserve, in the western part of the Province, is crossed on its full length by the road leading from Montreal to the Abitibi region. It is remarkable for its numerous lakes and rivers which provide favourable conditions for long canoe excursions. Fish include grey trout, northern pike, pickerel, black bass, and, in a limited number of lakes, speckled trout. There are two establishments for the accommodation of travellers, also a stopping place maintained by the Department of Game and Fisheries where cabins and boats may be rented.

Acreages of these parks in square miles are given below:—

Park	Sq. Miles	Park	Sq. Miles
Laurentides.....	3,670.00	Trembling Mountain.....	1,204.00
Mont Laurier-Senneterre Road, Fish and Game Reserve....	2,800.00	Gaspesian.....	340.00
		Mount Orford.....	21.00
Total.....	8,035.00	square miles	

Ontario.—There are six Provincial Parks in Ontario. With the exception of Ipperwash Beach Park, which is maintained exclusively for camping, picnicking and swimming, they are all dedicated primarily to the preservation of the forests, fish, birds, and all forms of wild life. The recreational possibilities which they provide are varied and extensive. A statement of the acreages of the Provincial Parks is given below.

Algonquin Park is a wilderness area accessible by highway from the southern boundary and by Canadian National Railways from both the north and south boundaries. There are first-class hotels and good camping facilities, with excellent fishing and attractive canoe trips. Quetico Park, also a wilderness area, affords good camping facilities, fishing and canoe trips. Lake Superior Park is another wilderness area. Camping facilities have not yet been provided nor canoe routes defined but there is good fishing. Sibley Park is a wilderness area as yet without camping facilities. Rondeau Park is partly cultivated, with fine timber stands and highly developed camping facilities. There are some enclosed animals and others running wild: fishing is fair and special duck shooting licences are obtainable. There are no canoe routes in this park. Ipperwash Beach Park consists of sandy beach and woodland area with highly developed camping facilities. There are no wild animals, but the fishing is fair. Special fishing licences are available in Algonquin and Quetico Parks.

<i>Total..... 5,229 square miles</i>			

Manitoba.—Although Manitoba has many areas attractive to the sightseer and vacationist, the Province has as yet established, officially, only one which may be described as a Provincial Park. This is the area set aside in 1930 as the Whiteshell Forest Reserve, a rugged section of the Precambrian part of eastern Manitoba. The physical characteristics of this area account for its distinctiveness as a recreational, fishing and hunting reserve. More than 200 lakes and several rivers provide a network of canoe routes throughout the park. Lichen-covered rock cliffs rise steeply from the water and much of the land is rough, hilly and thickly forested with the contrasting green of pine, spruce, poplar, birch and tamarack. Although much of the northern Whiteshell remains in its primitive state, several southern lakes have been developed as resorts. West Hawk, Falcon, Caddy, Brereton, and White Lakes have become most popular. Fishing is an outstanding attraction of the Whiteshell Forest Reserve, with northern pike, pickerel, lake trout, bass and perch the most prevalent species. A large sport-fish hatchery with a capacity of 500,000 eggs was constructed in 1942. Game-bird and big-game hunting have long been popular in northern Whiteshell, though much of the southern portion has been set aside as a game preserve. Early maps show that La Vérendrye was the first white man to explore what is now the Whiteshell Forest Reserve. In 1734, he followed the turbulent Winnipeg River, which roughly outlines its northern boundary. Manitoba's "Land of the Granite Cliffs" has had a colourful past and plans for new scenic highways in this region promise it an interesting future.

Other forest reserves in the Province have important recreational values and are being developed. The Singoosh Blue Lakes area in the Duck Mountain Forest Reserve has been of local importance for camping and fishing and a road is under construction to Wellman Lake, the largest lake in this Reserve.

An area of 3 sq. miles in the Turtle Mountain Reserve has been made into a portion of an International Peace Garden.

A list of the Provincial Forest Reserves with acreages is given below:—

<i>Forest Reserves</i>	<i>Sq. Miles</i>	<i>Forest Reserves</i>	<i>Sq. Miles</i>

Total..... 4,381 square miles

Saskatchewan.—Saskatchewan's nine permanent park reserves are distributed over the southern part of the Province. They are well treed and contain many beautiful lakes providing facilities for quiet recreation, camping, hiking, fishing and boating. A short description and acreages of these parks is given below:

Cypress Hills Park, south of Maple Creek and a few miles from the United States boundary, is beautifully located in the heart of a provincial forest area; this park has modest bungalow, lodge and cabin accommodation, and an auto-camp equipped with camp kitchens, spring water, and wood for fuel. Moose Mountain Park, an area honeycombed with lakes and thickly covered with poplar and white birch, is located about 15 miles north of Carlyle, and is popular with visitors from the United States because of its fine scenery and good fishing. Katepwa Park, about 60 miles northeast of Regina, on the famous Qu'Appelle Lakes, has camp kitchens and bathhouses and offers boating, fishing and safe bathing. Good Spirit Lake Park, 20 miles west of Canora, also offers good fishing and bathing, and has excellent camp and picnic grounds with kitchen and bath-house. Greenwater Lake Park in the forest belt north of Kelvington consists mainly of virgin forests and lakes affording good bathing and fishing. Little Manito Park on Manitou Lake, is renowned for its medicinal qualities: chateau, cabin, and tourist-camp accommodation are available. Duck Mountain Park, 15 miles northeast of Kam-sack, presents a well-forested area and beautiful Madge Lake, which has a shore line of 47 miles, densely wooded and with sandy beaches. Wildlife is plentiful and the lake is well stocked with fish.

Alberta.—Although Alberta has a larger area of National Parks than any other province, many small park areas have also been set apart by the Provincial Government. The acreages of the parks are given below.

Aspen Beach Park on the shore of Gull Lake, west of Lacombe, is primarily for bathing, outing and picnic purposes; Saskatoon Island Park west of Grande Prairie has been reserved mainly for picnic purposes; Gooseberry Lake Park, on the shore of Gooseberry Lake, north of Consort, has a sports ground and a number of cottages, and accommodation for transients is available in the town of Consort; Lundbreck Falls Park is a pleasant little beauty spot on the Crowsnest Pass High-

way west of Macleod, popular with fishermen and motorists; Sylvan Lake Park, on the shores of Sylvan Lake, 11 miles west of Red Deer, is a popular bathing place; Hommy Park, in the vicinity of Albright, was established to serve residents of the district with picnic and outing facilities; Ghost River Park, is on a beautiful artificial lake on the Ghost and Bow Rivers, west of Calgary; Park Lake Park provides picnic facilities for the districts north and west of Lethbridge; Assineau Reserve, on the Assineau River south of Lesser Slave Lake, is set aside to preserve a fine stand of large spruce; Dillberry Lake Reserve, on the Alberta-Saskatchewan boundary near Chauvin, was established to preserve the natural beauty of a picturesque lake; Writing-on-Stone Reserve, on the Milk River east and north of Coutts, was established to preserve natural obelisks on which appear hieroglyphics which have never been deciphered; Saskatoon Mountain Reserve has a fine lookout point in the Grande Prairie district; Little Smoky Reserve is a picnic ground and big-game hunting base on Little Smoky River, 12 miles south of Falher; Bad Lands Reserve, north of Drumheller, was established to stop unauthorized removal of fossilized remains of pre-historic animals; Wapiti Reserve, on a canyon in the Wapiti River ten miles south of Grande Prairie, is an outing centre for the rural district and also for the use of big-game hunters.

British Columbia.—With its spacious scenic areas, no province is richer in potential park areas than this Province. British Columbia has 3 classifications of parks: Class A, 18 in number, of high recreational value; Class B, large parks allowing multiple land use are 4 in number; Class C—a community-type park contains 27 areas. These 49 parks have a combined area of 11,481 square miles. In addition, there are five Special Act Parks with a total area of 5,415 square miles.

Mount Seymour Park near Vancouver and Manning Park on the Hope-Princeton Highway are two of the most important Class A parks and provide both summer and winter recreational opportunities. Both Tweedsmuir and Wells Gray Parks are in Class B and possess outstanding mountain, lake and river scenery as well as some of the finest fishing and big-game in the Province. Tweedsmuir Park is the largest wilderness park in North America. Garibaldi Park, a short distance from Vancouver, is the most outstanding of the Special Act Parks. This rugged alpine area of peaks, glaciers and snow-fields is famous for its meadows of vivid wild flowers and strange geological features. Liard River Park on the Alaska Highway and Strathcona Park in the centre of Vancouver Island are other Special Act Parks rapidly coming into prominence. The smaller Class C parks are strategically located throughout the Province to provide many communities with opportunities for convenient outings. The following statement gives acreages of all the Provincial Parks:—

Section 4.—Game and Scenery

The resources of Canada from the standpoints of the sportsman and tourist are both unique and varied. In the wooded and unsettled areas there are caribou, moose, deer, bear and smaller game, while in the western part of the Dominion there are also wapiti, mountain sheep, mountain goat, and grizzly bear. Mountain lion or cougar, are found in British Columbia and in the mountains of Alberta, while in the northwest and far north there still exist herds of buffalo and musk-ox, which are given absolute protection by the Federal Government.

Ruffed grouse or "partridge" are found in the wooded areas of Canada from coast to coast. Sharp-tail grouse or "prairie chicken" inhabit the open prairies and the partly timbered areas of the three mid-western provinces. The Franklin grouse is native to the mountains of the west; the ptarmigan, an Arctic grouse, lives in the treeless northern plains and is also found in the high mountains of Alberta and British Columbia.

The valleys of Nova Scotia and New Brunswick, the broken lake-country of northern Quebec, Ontario, Manitoba and Saskatchewan, as well as the mountain districts of British Columbia and Alberta, offer a variety of attractions that have won for Canada a reputation as a paradise for sportsmen and campers. Not only are these attractions available to those who travel by land and air, the lakes and rivers that form a network over the eastern part of the country particularly, make water travel in smaller boats or canoes feasible and attractive. Further, winter sports, the unusual attractions of winter scenery and the bracing though rigorous winter climate, may be enjoyed at many winter and year-round resorts. In both National and Provincial Parks, while angling is permitted, the hunting of game is forbidden, and the wildlife resources preserved.

Migratory Birds Treaty.—The Migratory Birds Treaty and the legislation making it effective throughout Canada are administered by the National Parks Bureau of the Department of Mines and Resources and the Royal Canadian

Mounted Police. The Treaty, which has been effective since 1916, has as its object the protection of the valuable migratory bird life of Canada and the United States. Information concerning the Treaty, and regulations enacted for its enforcement, may be obtained from the Controller, National Parks Bureau, Department of Mines and Resources, Ottawa.

PART VI.—CLIMATE, METEOROLOGY, ETC.

Section 1.—Climate

At page viii at the front of this volume under the heading "Climate and Meteorology" the articles that have appeared in previous editions of the Year Book are listed. Many of the statistical compilations that accompany those articles were built up on the basis of long term averages and are still of value but, in recent years, the science of climate and weather has advanced considerably and a great many more stations for the collection of data have been established across the Dominion. This is especially true of the period since 1939 and the rapid growth of aviation.

The current article on the Climate of Canada, Part I of which is given below, represents a more comprehensive treatment than has previously been carried in the Canada Year Book.

THE CLIMATE OF CANADA*

NOTE.—This article, the first that has appeared in the Year Book on this subject since 1929, is planned in two Parts. Part I, here presented, discusses very comprehensively the Climatic Regions of Canada. Part II which will appear in a later edition will present detailed tabulations of data on climatic factors for a wide range of stations across Canada.

There are many types of climate in Canada. This is to be understood from its position as the northern half of a continent and its area, stretching from the northernmost island of the Arctic Archipelago (only 490 miles from the North Pole) to Middle Island in lat. 41°41'N. at the southwest end of Lake Erie.

A time in winter might be found when a flight from Louisburg in Nova Scotia to the northwestern tip of Yukon, southward to the southern tip of British Columbia then eastward to the starting point, would, over the more than 9,000 miles covered in about 48 hours time, experience weather similar to that simultaneously occurring in Siberia, England, Italy, parts of China and Japan.

The climate of a country of such wide expanse affects living conditions and industry everywhere within its area. There are definite advantages which Canadians enjoy in the possession of a variety of climate such as this, but there are also disadvantages. Under each of the headings designating the Climatic Regions given below, the effects of climate upon local conditions, especially in relation to the land and agriculture, are dealt with rather fully. However, climate also affects urban life, although its applications here are not so capable of descriptive treatment. As an example, however, much progress has been made in recent years in the introduction of artificial modifications of climate to processes of manufacturing and definite benefits have accrued. This applies particularly to the textile industries, to certain photographic processes of reproduction and to many other activities.

* Prepared under the direction of Andrew Thomson, O.B.E., M.A., Controller, Meteorological Division, Department of Transport, by A. J. Connor, M.A., Head of Climatological Section.

Developments are also well advanced in humidifying offices and homes and in this process both temperature and water-vapour content of the air are brought under control.

The expense involved for both temperature and humidity control is naturally heavy where wide extremes of temperature are common. For instance, the amount of fuel consumption necessary to maintain a temperature of 65°F. in winter is very closely proportional to the difference between this temperature and the outside air, all other factors, such as type of construction and size of building, being equal. The problem resolves itself into making up the deficit of heat required to maintain a building at a certain temperature, say 65°F. in any particular locality. Such a deficit is expressed by engineers and others in day-degrees and calculations show that in Victoria, B.C., for instance, a deficit of 4,935 day-degrees must be made up to maintain the winter temperature of 65°F., whereas, for Vancouver, B.C., the figure is 5,303 and for Prince Rupert, B.C., 6,195. This means that annual fuel consumption would be 8 p.c. more at Vancouver, B.C., and 25 p.c. more at Prince Rupert, B.C., than at Victoria, B.C. At Toronto, Ont., a fuel bill for a standard building such as that under consideration would be 47 p.c. more than at Victoria, B.C., at Montreal, Que., 68 p.c. more and at Halifax, N.S., 50 p.c. more.

The above examples relate only to temperature, but water-vapour content is also an important consideration. As a generality, it may be assumed that 94 grains of water vapour must be mixed with each pound of dry air at 65°F. to reach 100 p.c. relative humidity. On the Pacific Coast there are normally 31 grains per pound available outdoors in January. After such air has entered the building and been heated to 65°F., the relative humidity indoors will be 31/94 or about 33 p.c. On the prairies with only 4 grains of water vapour per pound in the outside air, living conditions indoors are at a relative humidity of about 5 p.c. unless water vapour is artificially added. In the Lower Great Lakes Region the corresponding relative humidity is 14 to 17 p.c. on the average in January, and much the same in the Atlantic Provinces.

Problems in summer time are of exactly opposite character. As air is cooled it is necessary for comfort to dispose of surplus humidity. Such problems, while within the domain of the heating and ventilating engineer, depend on practical climatology for their solution.

The Meteorological Service of the Federal Government is also called upon to supply special data in the fields of medicine and chemistry. Aeronautical engineers require precise data on the conditions that exist in different levels of the upper air, etc.

From what has been said, it will be obvious that the continental expanse of Canada cannot be dealt with other than as a number of Climatic Regions, within each of which seasonal changes are sufficiently similar so that they can be dealt with as a unit, while important contrasts with other Regions are emphasized.

These Climatic Regions are (1) The Atlantic Provinces of Prince Edward Island, Nova Scotia and New Brunswick but including the Gaspé Peninsula of Quebec; (2) The Laurentian Plateau within the areas of Quebec, Ontario and Manitoba; (3) The Lower Great Lakes or the area lying between Lakes Huron and Ontario, north to the Ottawa River and southward to Lake Erie with an extension along the St. Lawrence River to Quebec City; (4) The Southern Prairies (approximately as far north as the North Saskatchewan River); (5) The Southern Interior Valleys of the Mountains of British Columbia; (6) The Pacific Coast and Coastal Valleys;

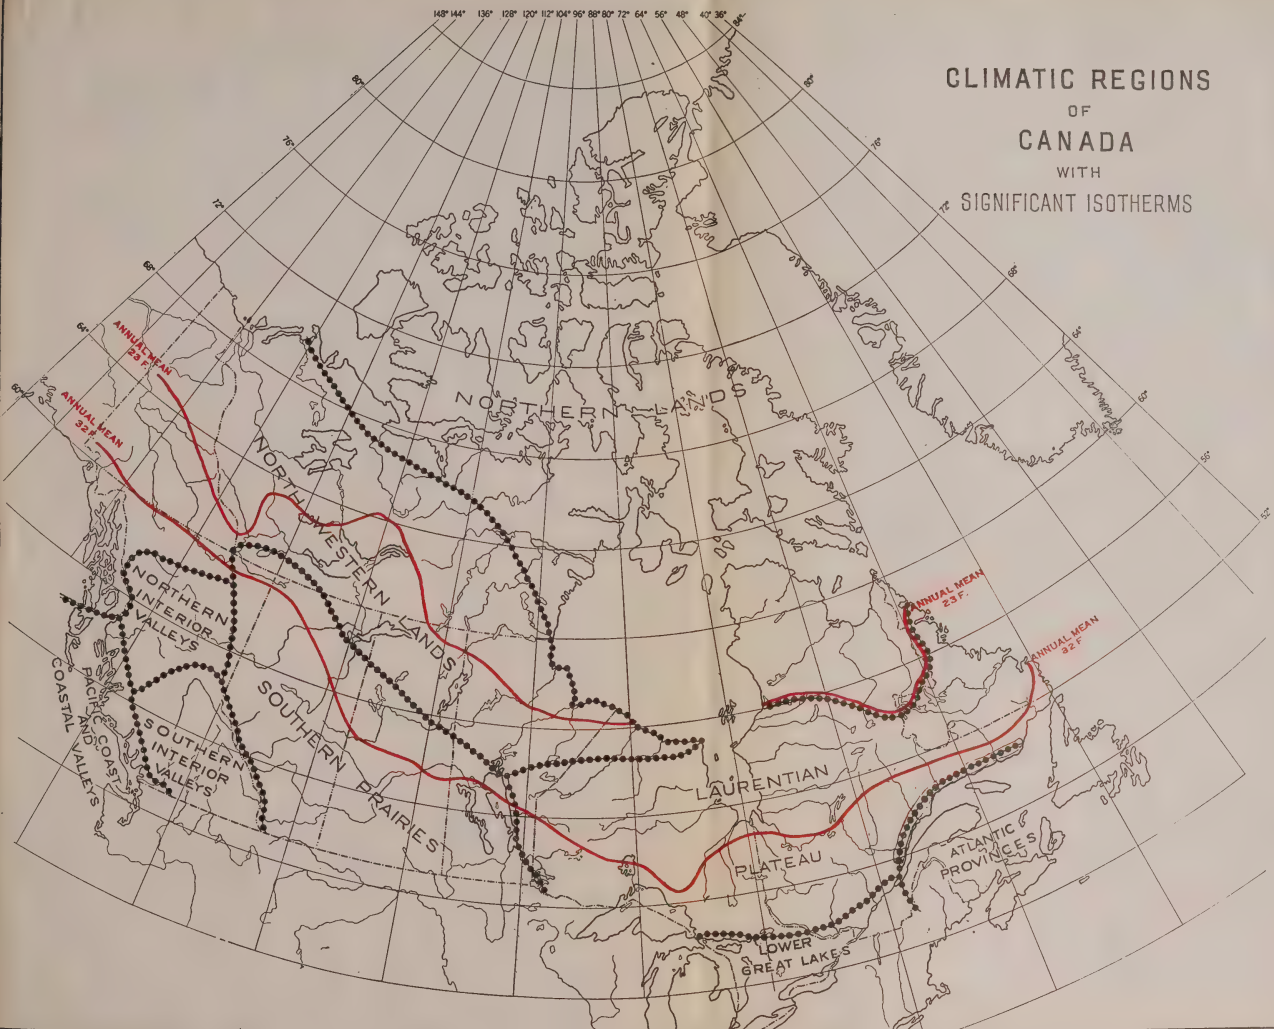

CLIMATIC REGIONS

OF

CANADA

WITH

SIGNIFICANT ISOTHERMS

(7) The Northern Lands including the Arctic Archipelago; (8) The Northwestern Lands including most of the area drained by the Mackenzie River and the Yukon River. These Climatic Regions loosely correspond to well-known orographical and geological regions but it is not possible to follow them very closely in defining boundaries. The boundaries of the Climatic Regions are not sharply defined, chiefly because the changes in the character of the seasons through a long period of years correspond to recurring shifts of the climatic borders. The outstanding features of each of these Regions are briefly described below.

The Atlantic Provinces

Temperature.—The Atlantic Provinces, which might be expected to have a purely maritime climate, are served principally by air moving eastward off the North American Continent. The climate is, therefore, continental in character. This is easily proved by the fact that the mildest lowlands of these Provinces average only 15°F. to 25°F. in January and February, while the milder portions of the Pacific Coast average 35°F. to 40°F. in these months. The coldest day ordinarily expected in an average winter on the Bay of Fundy averages zero or a little lower for twenty-four hours but the coldest day ordinarily expected at Vancouver, B.C., will average 22°F. or 28°F. at Victoria, B.C. This difference of twenty degrees, or more, arises from the arrival of cold waves by an ocean route to the maritime areas of British Columbia but by a land route to the Atlantic Provinces. Again, in the Atlantic Provinces there is a greater difference between the temperature of the coldest and warmest months of the year. At Gaspé, Que., there is a difference of 52°F. between the temperature of January and of August, and 42°F. at Saint John, N.B., and Halifax, N.S. Compare these figures with a difference between midwinter and midsummer of only 13° to 20°F. on the outer coast of British Columbia and 20° to 26°F. along the Gulf of Georgia. The prevailing drift of air from the land to the ocean also helps to increase the warmth of the Atlantic Provinces in summer by allowing air which has been strongly heated on the southern portion of the Continent to create occasional hot spells with a southwesterly wind. The effect is seen in the average temperature of 65°F. at Halifax, N.S., in July or August. This may be compared with 54°F. to 58°F. on the outer coast of Vancouver Island. Only the inner coastal valleys of British Columbia can approach this warmth in midsummer. While the continental character of the Atlantic Coastal Region, as compared with the Coastal Regions of British Columbia and of Europe, is, of course, not pronounced in the same sense as that of the continental interior, yet the interior highlands of the Atlantic Provinces exhibit this character more obviously. These highlands are scarcely mountainous but they rise to flat-topped hills exceeding 3,000 feet in the Gaspé Peninsula and to uplands exceeding 2,500 feet in northwestern New Brunswick. Ridges which lie just north of the Bay of Fundy rise to 1,200 feet in some places. Ridges or plateaux of 1,200 feet also occur on Cape Breton Island while on the mainland of Nova Scotia ridges or hills look down 700 to 1,000 feet to tide-water. Very cold polar air entering this Region from the north does not warm readily during slow passage especially when the ridges are snow-covered. On at least an occasional night in January and February in any average winter it may be expected that the temperature will drop to 30°F. below zero in the northwestern

New Brunswick highlands, and to 20°F. below zero in the southern valleys and to 10°F. below zero on the Bay of Fundy. These are not the extreme lowest temperatures of record but only the average low points of all winters recorded. Among the lower ridges of Nova Scotia 15°F. or more below zero may be expected and 5°F. below zero at Halifax, N.S. Yarmouth, N.S. temperature will, ordinarily, not descend to zero, but 10°F. below zero may be expected on Prince Edward Island.

Occasional temperatures between 80°F. and 90°F. may be expected every year in June, July, and August in all districts and also in late May and early September in the interior of New Brunswick. To offset these high temperatures of summer there is the ever-present danger, during a spring or autumn inflow of polar air, of local frosts amid the interior valleys. Air which has been cooled on the many-faceted hills by nocturnal radiation to a clear sky on a calm, cloudless night descends easily towards the lowlands. The difference in temperature early in the night between ridge and valley may be so great that the gain in heat caused by compression during descent is not enough to bring the descending air up to the temperature of the air on the valley-floor. The descending air is, therefore, denser and will raise the warmer valley air completely off the floor. As cooling of the ground by outgoing radiation continues, the cooler and denser air gravitates to hollows and flats which cannot discharge this denser air to still lower ground. In these places, with blocked or poor drainage, local frosts may occur but often such places have rich soil and are, therefore, preferred for agriculture to the less fertile well-drained slopes. Low temperatures occur in valleys and in cranberry bogs due to cool-air drainage from the surrounding slopes. Frequently, fog collects over the low-bush cranberry but does not protect the berries from danger from this cold air flowing down the slopes and settling beneath the bank of fog. The situation can be met by flooding the bogs from reservoirs on the slopes above. Such flooding would not, of course, be practicable in other than bog areas.

Most frost-free are the lands in this Region along the shore of the Bay of Fundy with an average of 155 to 165 days continuously without frost. Grand Manan Island averages 177 days. Coastal points in Nova Scotia are frost-free for lengthy periods, Yarmouth for 159 days, Halifax 155 days, Pictou and Port Hastings 153 days, Digby 152 days, but around the bay at Sydney only 137 days. Islands of small size have long frost-free periods; St. Paul Island 155 days, Grindstone in the Magdalen Islands 156 days, and Sable Island 204 days. In the valleys the period is shorter. Back of the ridge which faces the Bay of Fundy in New Brunswick, Sussex averages 105 days and frost has occurred as late as June 20. Further into the interior of New Brunswick places with good drainage, especially to water surfaces, average 125 days while poor sites average less than 100 days. The difference between coast and interior in northern New Brunswick is well shown by Chatham with 133 days while Kedgewick has only 72 days. In the upper St. John valley, Edmundston, Grand Falls, and St. Leonard have 112 to 115 days. In Nova Scotia, the Annapolis Valley, where apples are largely grown, has frost-free periods varying from 98 days at Middleton to 139 at Annapolis Royal and 148 at Wolfville. In among the highlands looking down towards Halifax and the sea, at Mount Uniacke, there are 97 frost-free days, at Upper Stewiacke 93, and only 77 at Stillwater, but Truro has 105 days and Liverpool 108 days. On Prince Edward Island local variations are smaller: there are 135 frost-free days in the extreme northwest and 149 to 157 elsewhere. These local frost-free periods play an important part along with soils and markets in helping the agriculturist to decide upon what crops or mixture of crops will best pay for labour in his locality.

Precipitation.—In this Region, precipitation is usually ample for most purposes; 50 to 60 inches of water annually on the wetter outer coast of Nova Scotia, 40 to 45 inches on the Fundy shore and in the interior of Nova Scotia; 32 to 40 inches in New Brunswick, in the interior and north, and the same in Prince Edward Island. Of this annual total 7 to 10 inches arises from the water-content of freshly-fallen snow, the larger figure belonging to the interior of New Brunswick and the Gaspe Peninsula, Que. In these northern sections the proportion of precipitation in the form of snow is large in midwinter and good accumulation of snow in the forested highlands is advantageous for lumbering but fails in some winters. Years with least snowfall, especially in Nova Scotia, are marked by a more maritime character of the winter. Intrusions of polar continental air into the Region become less frequent or weaker and are replaced in part by a flow of air from a southerly direction moving along the Atlantic seaboard. In the more extreme cases the air moves up from the tropical areas of the Atlantic, almost wholly by a sea-route. Almost every year brief incursions of such air will occur for a day or two with temperatures higher than 50°F. in Nova Scotia in January and 45°F. to 50°F. at least in February, but the mildness is less effective in New Brunswick. When in winter, air of this character is followed immediately by fresh polar air moving southward or south-eastward through Quebec and New England, U.S.A., very stormy weather ensues. Tropical air in summer brings uncomfortable humidity which is comparable to the most trying humidity of the Lower Great Lakes Region. Temperatures then reach 85°F. to 90°F. or higher during the day, in air with such a heavy content of water vapour that the humidity condition reaches 100 p.c. as soon as the evening-cooling reduces the temperature below 75°F. Such conditions are usually of much shorter duration in the Atlantic Region than in southern Ontario. The maximum incidence of fog, June to August, coincides with the chilling of moist, southerly air by the cold, coastal waters.

The following statement gives typical temperatures and precipitation of this Region:

TEMPERATURES
(Fahrenheit)

The Laurentian Plateau

General Description.—The area known as the Canadian Shield covers nearly 2,000,000 square miles extending from Lake Superior westward to Lake Winnipeg, northward to the shores of the Arctic Ocean, and includes the territory eastward to the Labrador Coast, except the Hudson Bay and James Bay Lowlands. The southern limit in the east runs close to the Ottawa River and the north shore of the St. Lawrence River and Gulf. Climatically, this Shield is too large to be consid-

ered as one region. In this article the southern limit of permanently frozen subsoil is regarded as the northern limit of the eastern position of the Laurentian Plateau Region.* While a sufficient number of actual borings to determine accurately the position of this boundary have not been made yet, such data as are available indicate that the subsoil is permanently frozen along the annual isotherm of 22°F. or 23°F. This line runs from the main fork of the Nelson River to near the mouth of the Severn River which empties into Hudson Bay. On the east coast of Hudson Bay it begins near the mouth of the Great Whale River and runs to the divide between the St. Lawrence and Ungava Bay drainages near latitude 55°, reaching the Labrador Coast at Hebron. Since the region so defined lies immediately north of the earliest and most populous settlements in Canada, it might be supposed that the pressure of population would have carried settlers north in great numbers onto the Laurentian Plateau. This is not so, since the land is naturally unsuited to agriculture, partly on account of the nature of the soil but largely because the short frost-free period involves too great a hazard of failure.

Temperature.—There are in this Region extensive areas of glacial clay and sediments suitable for successful agriculture if there were a satisfactory continuously frost-free period. Unfortunately, summer outflows of polar air pass southward over the cold waters of the inland sea with very little modification and, this dense air settles into the valleys and depressions where the arable soils lie. Night radiation from rocky hills and ridges to a clear sky and subsequent drainage of chilled air to the low levels further increase the danger of frost. The length of the period continuously free from frost, therefore, varies considerably with the topography: for instance, at White River, surrounded by low hills, the average is only 42 days — from June 26 to Aug. 8 — at Hornepayne, to the north of White River, the average frost-free period is even lower being only 34 days, that is from June 29 to Aug. 2 (frost has occurred in many years in July). Where agriculture has been reasonably successful there are lower levels to which the frosty air may drain; for instance, at Haileybury, on the shore of the comparatively large Lake Timiskaming, the frost-free period rises to 123 days, certainly a long enough period for ordinary agriculture, but at Heaslip, a short distance north of Haileybury, the period falls to 71 days.

The most successful attempts at agriculture have been in the region of Lake Timiskaming and the continuation of this valley northward to Cochrane. Along this stretch of territory the most suitable sites have an average of 85 days continuously frost-free. Even the fast drainage along long rivers appears to be favourable since Kapuskasing, on the Kapuskasing River, averages 79 days.

Along the north shore of Lake Superior fast drainage of cold air towards that Lake is favourable for the lengthening of the frost-free period. At Port Arthur, there are 117 frost-free days and at Kakabeka Falls, 95 days. Similar effects occur near Lake Nipigon where at Cameron Falls the average is 106 days. The effect of proximity to large lakes is also shown by the splendid record of 127 frost-free days for Kenora, in the Lake of the Woods area. By contrast, Savanne, about 75 miles to the northwest of Port Arthur, averages only 32 days and Longlac, about 100 miles further on, only 46 days.

* From the point of view of possible agriculture this Climatic Region is considered to include the whole of the territory around James Bay even if it is not everywhere geologically similar to the Laurentian Plateau. The maximum effect of the water of James Bay in lengthening the frost-free period is indicated by the record at Moose Factory which is on an island of the Moose River. This place averages 87 days free from frost from June 15 to September 10. By contrast the station at Great Whale River on the opposite shore of James Bay averages only 54 days and at Fort George only 72 days.

It seems, therefore, that the choice of land for agricultural settlement must be very carefully made to avoid disaster. In the section of the Laurentian Plateau Region which lies in the Province of Quebec, similar very large variations are found in the frost-free period according to locality. An eighteen year record at Doucet, along the Canadian National Railway, 356 miles northwest of Quebec city, showed an average of 28 frost-free days from July 3 to July 31. On the other hand, near large lake-surfaces or close to swiftly running streams there have been points of observation where the frost-free period has averaged 75 to 125 days.

In the central and western districts of this Climatic Region, January averages 5 to 10°F. below zero, while the warmest month of the year averages 57 to 65°F. Occasionally, really warm days may be expected in any year in June, July, and August when the temperature may exceed 85°F.: there have, moreover, been rare occasions during the period of record when a few points have recorded temperatures between 100 and 110°F.

Precipitation.—There is sufficient precipitation over the Laurentian Plateau; this averages 30 to 40 inches annually over the greater portion of the Quebec sections and 22 to 30 inches in the districts which lie in the Province of Ontario. Coincident with the boundary on the north of this Climatic Region, that is, the annual isotherm of 23°F., there is a sharp fall in the quantity of the annual precipitation. At or near this line, the annual amount falls below 16 inches. The peak of annual precipitation occurs in July, generally exceeding three inches but in some localities five inches. The increase in the rate of precipitation is noticeable in most years early in May, while the diminishing rate at the close of summer becomes quite noticeable in October. The exception is found along the north shore of the Gulf of St. Lawrence where there is another maximum of precipitation in the winter. This arises from the drift of saturated or near-saturated air across the Gulf of the St. Lawrence against the steep slopes of the north shore. A somewhat similar peculiarity is limited to the steep slopes leading down to Lake Superior north of Sault Ste. Marie. Here there is heavy snowfall in the winter months. This is indicated by an annual total snowfall at Steep Hill Falls of 174 inches. In general, over the whole Region the annual snowfall contributes 5 to 10 inches of water towards the total annual precipitation.

While this Climatic Region is not eminently suitable for agriculture, it is valuable because of mineral and forest wealth and its potential and developed water power. The resulting industries have created populous towns and villages and the climate is not regarded as unduly severe by the inhabitants.

The following statement gives typical temperatures and precipitation of this Region:—

The Lower Great Lakes

Temperature.—The winters in the Climatic Region of the Lower Great Lakes are mildest around Lake St. Clair, on the north shore of Lake Erie, in the Niagara Peninsula, and along the western shores of Lake Ontario. The coldest winters occur on the ridges between Lakes Huron and Ontario and east of Georgian Bay into the highlands between the Ottawa and St. Lawrence Rivers. The incidence of late and early frosts during the agricultural season conforms fairly well to the same pattern of distribution. In the Lake St. Clair and western Lake Erie area the average length of the frost-free period is 160 to 195 days; in the Niagara Peninsula 165 to 170 days; and on the western shore of Lake Ontario 165 days, but the period diminishes rapidly upslope to the west, and within a distance of less than twenty miles is reduced to 150 days. In poor situations, on the ridge between Lakes Huron and Ontario, particularly near marshes or along the now dry bed of glacial streams, the average continuously frost-free period is 130 days or less. The highlands in northern counties consist of narrow plateaux 1,200 to more than 1,700 feet above sea-level which can drain cooling nocturnal air into the intervening bottoms. Only where these lower lands have a good slope towards the Great Lakes, as is shown by swiftly-flowing streams, is the average frost-free period not greatly reduced.

Precipitation.—The Region of the Lower Great Lakes differs considerably from the Pacific Coast and the Prairies in having no marked wet season or dry season. There is in most years sufficient precipitation for successful agriculture. In occasional years portions of this Region have suffered mild droughts but generally there is dependability. Rain and snow may be expected in winter months with snowfall contributing a considerably larger proportion of the moisture than rainfall on the highlands in that season.

That part of this Climatic Region which lies east of the confluence of the Ottawa and St. Lawrence Rivers but mainly south of the St. Lawrence toward Quebec city, has slightly higher annual precipitation. In about one-half the years of record, there has been a noticeable seasonal maximum of precipitation in one of the months from June to September. On the other hand, between Lake Huron and the Ottawa River any slight annual peak of precipitation is as likely to be found in midwinter as in midsummer. This is an indication that the eastern districts of this Climatic Region at times form an extension of the Laurentian Plateau Region. This change of type is also indicated by the shorter length of the continuously frost-free period. This period falls off from about 150 days near the Ottawa-St. Lawrence confluence to 110 to 130 days in the townships south of the St. Lawrence River. The dependability of these townships for the cultivation of tender crops is, therefore, about the same as that of the northern portion of the Huron-Ontario ridges. It is, however, distinctly better than that of the interior of the eastern area of Ontario lying between the Ottawa and St. Lawrence Rivers. Here a spur of the Canadian Shield crosses southward to the St. Lawrence River to reappear again in upper New York State, and in the vicinity of this spur some points average less than 100 days continuously frost-free.

On the interior plateaux snowfall accumulates steadily in some winters during January and February and absorbs occasional light rainfalls with regelation in the intervals. Should a very heavy rainfall then occur in March or early April with rapidly rising temperatures, there will be almost total run-off of the rain from the icy highlands, followed by run-off of the disintegrating mixture of snow and ice.

RANGE OF VARIATION OF JANUARY MEAN TEMPERATURES AT PLACES INDICATED

CHAMP DE VARIATION DES TEMPERATURES MOYENNES DE JANVIER AUX ENDROITS INDICES

Spring floods thus occur in occasional years but in Ontario, along the Grand River Valley, remedial works have been undertaken to contain the flow over a sufficiently long period to minimize flood damage to the lowlands.

The Lower Lakes Region is traversed alternately by: (a) Cool, dry polar air from the north; (b) Pacific polar air that has become warmed and somewhat moister on the western portion of the continent; (c) Continental polar air returning quickly from the south and generally intermediate in character to (a) and (b); (d) Subtropical air, carrying by far the most water vapour and generally warm for the season. Alternations may be expected to occur about every three days with precipitation occurring at the margins of the moving airmasses, and measurable rain on 10 to 14 days per month from May to October. In the winter months rain may be expected on 4 to 10 days per month, the smaller number of occurrences being in January and February. Additional days with snowfall bring the number of days with precipitation in the winter months to 14 on the lowlands but to 18 or 20 on highlands facing Lake Huron, since cold air crossing an open lake surface is quickly saturated with moisture and will precipitate a portion of this vapour when it cools (below the higher dew-point which it acquired over water) by impinging on and climbing a cold highland. This process takes place most readily on the slopes facing Lake Huron and Georgian Bay. Rain in winter on the other hand requires incursions of subtropical moist air (generally aloft over colder air). The chance of this occurrence diminishes northward and at North Bay near the northern boundary of this Climatic Region the most likely numbers of days with rain are only 2 in January or February and 3 in March, but 6 in December or April. The character of the winter depends very much on the relative frequency of incursion by the types (a) to (c). Thus, Toronto in 105 years, has had a January which averaged more than 35°F. and also a January which averaged little more than 10°F. For the same reason in this Climatic Region, the accumulation of snow on the ground during and at the end of winter varies widely from year to year, but is generally more dependable on the higher ridges. Variation in the frequency of types (a) to (c) in a summer month can produce one of uncomfortably humid heat, one of mostly dry heat with relieving sharp drops of temperature at night or an unseasonably cool month with too much cloud and rain and disappointingly slow growth of those crops which demand high temperatures for maturity. The variations which have the greatest agricultural importance on the highlands of this Region are those of spring. A wet, cool spring which delays planting, endangers the harvest because only a portion of the normally short frost-free period is then available for growth. Prudence will then dictate such changes in agricultural plans as may seriously reduce possible income. The whole Lower Great Lakes Region is generally good for dairying. The Niagara District is best suited for fruit; the Lake Erie slopes are best for tobacco and field-vegetables for canning, but even tobacco may be grown near Lake Simcoe on suitable southern slopes, and hardy fruit almost anywhere if soils are favourable. Peaches, apricots, and sweet cherries, demanding a long frost-free period, are limited, commercially, to the Niagara District and a portion of the area to the west along the Lake Erie shore. Tobacco may also be grown in the Quebec extension of this Region.

The Southern Prairies

There appears to be a widespread impression that the Canadian Prairies are a nearly level plain and that, therefore, the climate must vary little over its whole extent. Actually, this Region might better be described as a very wide slope deeply cut by rivers and marked by escarpments and plateaux and merging in the west with the foothills of the Rocky Mountains.

Temperature.—On the Prairies in winter, while all cold spells are caused by an outbreak of polar air, the cold wave may pass quickly southeastward to be replaced by a flow of much milder air from the west or southwest. On the other hand, with a steady flow of very cold air crossing the polar seas into Canada, the cold spell may last several weeks with little relief. In some winters a month may elapse with polar air mostly moving southward by way of the north Pacific Ocean and entering the Prairies after considerable warming during long travel. There have been cases where such a month has averaged more than 25°F. warmer than a normal winter month over a large area in Alberta, and 10°F., or more, warmer over the remainder of the Prairies. These cases do not exhaust all the possibilities, for polar air has in some winter months followed mostly a path across the Arctic Archipelago to Hudson Bay and northern Quebec. In such cases, while Manitoba and Eastern Canada experience very cold weather, Saskatchewan and Alberta are mainly fed by warmed returning polar air from the southeast or Pacific polar air from the west. The character of the prairie winter is, therefore, very variable from year to year, and dependent upon the path and direction of air flowing through the polar regions and the amount of precooling which it has undergone before reaching the Prairies. The great variations in summer temperatures are indicated in the remarks upon the lack of dependability in rainfall on p. 52. Great daytime heat is generally the accompaniment of drought. Contrariwise, although the advent of cool waves may bring welcome rainfall, they may also bring at least scattered frosts. These will follow the rain after the warm, moist air has been lifted off the land and replaced by the cool dense air of the cool wave. During the clear following night the coolest air gravitates to all places which are relatively lower than the surrounding land. If there is no further drainage possible and there is no wind to mix the bottom air with the warmer air above, the continued loss of heat by radiation from the land to the transparent sky may bring frost to the depressed places before sunrise. Only a limited portion of the Southern Prairies has an average continuously frost-free period of 100 days or more. This period diminishes northward to less than 70 days immediately north of the North Saskatchewan River. There are, of course, some places in an otherwise rather frosty region which have an unusually long frost-free period. In these places the lower land is occupied by a water-area, such as a lake

or a widening in a river. The cooling, dense air can flow out upon the water-surface, thus draining continuously the surrounding terrain. The warmer air raised off the water-surface, if there is no wind, will move slowly backward towards the nearby slopes. The effect is limited, of course, by the extent of the water-surface. Crops planted upon the depressed soil formerly occupied by an ancient lake or river-widening which is now dry land, suffer the full effect of the cold-air-drainage to this portion of land. There are, therefore, many local anomalies both above and below the general average length of the frost-free period in each district. The general effect is to limit seriously the character of plants which may be successfully grown on the Prairies. Wheat and coarse grains which can withstand light frosts at the beginning of the season and suffer only a lowering of quality by light frosts just prior to harvesting, are the principal crops of the Prairies. Except in Alberta, the menace of frosts even to these crops becomes very serious north of the North Saskatchewan River, elsewhere than along lakes or rivers. In Alberta, districts with frost-free periods averaging 90 to 100 days may be found as far north as the Peace River Valley if attention is paid to the local air-drainage.

The Chinook.—One of the most striking features of the weather of this Region occurs in winter. This is that spectacular change from bitter cold to comparative warmth, generally called the 'chinook'. It is most pronounced in southern Alberta from which area have come occasional news pictures of the inhabitants playing tennis in midwinter in a district where not many hours before the temperature had been severely cold. Not all 'chinooks' bring temperatures quite so high but the contrast between the temperatures of one day and the next may be very striking. The greatest contrast occurs when a severe prairie cold wave has occupied western Alberta and eastern Saskatchewan for one to three days with temperatures well below zero and the whole mass of very cold air accelerates suddenly towards the southeast. In this case, air from the Pacific Ocean which has been lying over the coast and filling the intermontane valleys of British Columbia moves eastward, crossing the Rocky Mountains. While the denser low levels of the Pacific air can reach the plains of Alberta only with great difficulty, usually moving northward through the intermontane valleys, yet the dry upper levels of the Pacific air cross readily enough, descending into eastern Alberta. The temperatures produced at Lethbridge and Medicine Hat will depend upon the characteristics of the particular body of Pacific air which moves east from British Columbia. If the temperature at sea-level on the Pacific Coast had been in the neighbourhood of 40°F., the temperature of levels around 5,000 feet will, after descent to 3,000 feet among the Rocky Mountain foothills, reach a temperature of approximately the freezing point. This may represent a sudden gain of 50 degrees and, since the air is usually very dry, the sun shines brightly, the temperatures rise in the afternoon, while the snow lying on the ground is rapidly lost to the warmer, drier air by sublimation. On the second day, if the ground is bare, it will again be heated to a considerable extent by the brilliant sunshine so that the afternoon temperature on this day may reach 50°F. in February, for at least an hour or two at Lethbridge. If the body of Pacific air has been lying over the State of Washington, northern Oregon, and southern Idaho, U.S.A., for some days with bright sunshine, before moving northeastward into western Montana State and southern Alberta, the temperature of the air coming through the passes of the Rocky Mountains and the Bitterroot Mountains may be much higher than the 50°F. quoted for Lethbridge, in fact, 66°F. in February and 65°F. in January have been recorded for that city. The effect of the 'chinooks' is

not usually so spectacular at Edmonton but if the Pacific air spreads over the whole of the Prairies, a general mild spell is produced which is a welcome relief from the cold wave which preceded it.

The lower layers of the Pacific airmass are gradually cooled as they move eastward across the Prairies, particularly when in contact with snowy ground, while at the same time the air will have picked up as much moisture as it can carry at the temperature which it acquires during travel. Its power of licking up snow from the ground therefore rapidly diminishes. In the Western Provinces there is a general tendency to measure the extent of the 'chinook' by the area which is wholly or partly denuded of snow and from this point of view the eastern margin of a 'chinook' will rarely be distinguishable beyond the Saskatoon-Swift Current line.

Precipitation.—The Southern Prairies in direct contrast with the Pacific Coast, have a rainy season from late May to early September and a dry season during the late autumn, the winter and early spring. The rainfall is moreover not dependable from year to year. It is principally caused by the action of summer cool waves from the Arctic regions. Moving southward these lift warm, moist air which has accumulated on the Prairies. The cooling due to the lifting, may produce general rains or local thundershowers. General rains, the more unusual phenomenon, come from the lifting of extensive moist airmasses moving northward from the Mississippi Valley and adjoining regions. Local showers, more common, arise from local ascent into a dry, cold upper airmass. Failure of frequent excursions of cool northern air into the Southern Prairie Region during the summer produces droughts. The districts most subject to drought extend from southeastern Alberta into southwestern Saskatchewan. By contrast, the Red River Valley of Manitoba and the Edmonton district of Alberta have the most dependable precipitation. In the Southern Prairies the highest annual precipitation occurs on the Manitoba lowlands and in the foothills of the Rockies where it ranges from 20 to 25 inches. The peaks of thunderstorm-frequency occur in these two regions, more than 20 days of thunderstorms annually in southeastern Manitoba and more than 25 days in western Alberta. Planting of wheat sometimes begins in southern Alberta in late March and generally proceeds at successively later dates eastward and northward: the average date at which wheat appears above ground in southeastern Manitoba is about April 25. These dates are subject, sometimes, to considerable delays because of short periods of wintry weather with precipitation in spring. Planting may, therefore, not be completed till the first week in May or, in some sections the planting of spring wheat may be abandoned in favour of the planting of coarse grains because of the lateness of the season. If, however, sowing is accomplished in good time, early commencement of spring rains is generally imperative if a good yield of grain is to be expected. When the rains are delayed, the topsoil dries out rapidly leaving the seedlings subject to being blown out by the strong winds of late spring. Blown-out soil may often be replanted with success if good rainfalls occur in late May. It is not unusual, however, for spring rains to be disappointingly light or spotty and June may commence with little rain. Crops then depend upon July rains and if these are again poor and spotty, the results are disastrous—only less so are those years when the early summer rains cause rapid growth and high hopes which are dashed by heat and drought in July. Drought or years of little rain appear on the average to be associated with the time of sunspot maximum, while good rains appear to be associated with years at or near minimum of sunspots. There is, however, no regular or dependable correlation with the course of the sunspot period, and, therefore, no seasonal predictions of rainfall can

be made to assist the western farmer in planning his annual operations. Statistically, there appears no proof that sunspots cause weather anomalies but perhaps some common cause produces loosely correlated changes in both sunspots and climatic factors.

The following statement gives typical temperatures and precipitation of this Region:—

TEMPERATURES
(Fahrenheit) TOTAL PRECIPITATION

The Southern Interior Valleys of British Columbia

Temperature.—In the Okanagan Valley the average daily lowest temperature is above the freezing point by March 20 in most of the southern portion and by April 1 at the northern end of Okanagan Lake. It is generally possible to fight occasional frosts by the use of oil-fired or coal-fired heaters spaced through the orchards. As an aid to the fruit-growers, a special frost warning service has been maintained in these valleys so that a prediction may be broadcast by radio stations early in the evening. The most severe frosts, fortunately comparatively rare, accompany the arrival of arctic air by land-route through Yukon and adjoining regions into northern British Columbia and thence into the southern interior valleys. Cases have been noted where about 3 a.m. a drop of six degrees has occurred in an orchard within half-an-hour. In such cases, if more heaters are quickly brought into operation, enough air turbulence may be created to mix this very cold air with the warmer air at treetop level.

The Nicola Valley experiences daily minimum temperatures 3° or 4°F. lower than those of the Okanagan Valley in midsummer and 4° to 7°F. in the winter and early spring. The generally higher elevation of the Nicola Valley is partly responsible for the difference and the valley is best noted for cattle-ranches of very large extent.

In the Kettle Valley, arable lands are 1,750 to 2,500 feet above sea level, and the average length of the period continuously frost-free is too short in most places to encourage the growth of fruit. At Greenwood the average is 76 days, at Rock Creek 96 days, but at Grand Forks it is 134 days. Around Grand Forks there is a district where considerable fruit is grown but Kettle Valley is more subject than the Okanagan Valley to severe cold during short periods in the winter. This has some effect in limiting the varieties of fruit which may be successfully grown. Although the West Kootenay District does not attain quite as high an average temperature during the daytime of midsummer as the Kettle Valley, yet night temperatures in March are 2° to 6°F. higher than in the Kettle Valley and the nights of late September and early October are not so cool.

In the East Kootenay District average daily lowest temperature does not rise above the freezing-point until April 15, or later. At Cranbrook there are only, on the average, 79 days continuously frost-free. Farther north in the vicinity of Lake Windermere the frost-free period averages from 94 to 114 days.

In winter, the general trend of the valleys from north to south frequently allows quite cold air from northern British Columbia to flow southward. In the most eastern valleys, there are occasions when extremely cold air may enter from the Prairies either by passage directly through the passes of the Rockies or subsidence of the higher levels of the western face of a cold wave from the Prairies.

Precipitation.—The Southern Interior Valleys of British Columbia suffer from scanty rainfall so that there is no marked seasonal variation except that of temperature. In general, the Coast Range prevents the moist lowest layers of air off the Pacific Ocean from reaching the interior, except in a much modified condition. Principally, the drier high levels of Pacific air cross the coastal mountains and descend by a complex and very variable process into these Interior Valleys. Much of the comparatively small amount of water-vapour available for precipitation is as snow, deposited on the interior mountain ridges during the rainy season of the coast. By conservation of the run-off in summer from melting snow of the mountains, in storage-lakes and reservoirs, irrigation by gravity-systems is widely practised in the valleys. Where gravity-systems are not feasible, electric power may be developed from the fall of streams issuing from storage-lakes and this power can be used to pump water from lakes on the valley-floor to agricultural lands on fertile benches along the mountain slopes. On the whole, with ingenious use of the orographical features of the mountainous interior, the scarcity of rainfall may be overcome and even made advantageous. In this Region, summer heat may reach scorching proportions in the daytime, especially when dry air has travelled northward through the interior valleys of the Pacific lands of the United States to enter southern British Columbia.

In the valleys of the interior of this Region the annual precipitation is subject to wide variations at different locations. It varies between an average of 8 inches in the Okanagan Valley to 17 inches in the West Kootenay District and 19 inches at Salmon Arm.

The following statement gives typical temperatures and precipitation of this Region:—

The Pacific Coast and Coastal Valleys

Temperatures.—In the Pacific Coast and Coastal Valleys Region the period continuously free of frost on the outer coast as far north as the most northern portion of Vancouver Island is generally 220 to 230 days. Northward along the coast the period shortens to 170 to 200 days. Where the inlet, however, runs far inland or where the observing point is in the lee of a low coastal ridge, the period varies considerably. Much depends upon the local air-drainage; for instance, in the Queen Charlotte Islands, Ikeda Bay has, on the average, 218 days continuously frost-free while Massett, which is inland a short distance, has an average of only

168 days. Again, Prince Rupert, which is on an island, averages 195 days but nearby Port Simpson only 169 days. An occasional year is entirely free from frost in some localities.

On the inner coast of Vancouver Island, on the islands of the Gulf of Georgia, at the mouth of the Fraser River, and in the inlets of the southern mainland, the frost-free period exhibits considerable local variation. Along the shores of the southeastern portion of Vancouver Island there are places which average 250 days continuously free from frost, while generally at moderate heights on the east face of the same slopes the length of the period falls to 175 days at an elevation of 500 feet. Such points, of course, are mostly on inner tablelands or at the low levels of valleys occupied by streams or lakes. Locally, pools of cool air may collect at these places with a possibility of the formation of frost in the early spring and late autumn.

Along the northern reaches of east Vancouver Island and among the northern islands the frost-free period varies locally from 154 to 231 days. Among the inlets of the southern mainland the continuously frost-free period varies locally from 183 to 250 days and along the lower Fraser Valley from 178 to 231 days.

The coldest month in this coastal Region is January when temperatures average 40°F. on the outer coast of Vancouver Island and 38°F. or 39°F. along the Strait of Juan de Fuca. Northward along the east coast of Vancouver Island and at the mouth of the Fraser River it is two or three degrees cooler. Near the head of the lower Fraser Valley the average temperature of this month falls to the freezing point while along the northern stretch of the coast north of Vancouver Island the mean temperature varies very much as one penetrates an inlet. It is generally about 35°F. at the mouths of the inlets and as low as 25°F. at the heads of very long inlets. The warmest month is either July or August, averaging only 58°F. on the outer coast but up to 65°F. at the head of the lower Fraser Valley. It is difficult for the temperature to rise very high along or near the coast since the sea-breeze cuts in and lifts the heated air high above the coastal valleys in the early afternoon of the summer. With distance from the coast along the lower Fraser River the energy of the sea-breeze is dissipated and, when conditions are favourable, temperatures may well exceed 90°F. On an average of about once in fifteen years a cold wave similar to those experienced on the Prairies moves into far northern British Columbia and, following the general north-south trend of the valleys in the interior, may reach the coast, bringing temperatures to zero or lower for at least a day in the southern coastal region. Along the north coast and on the Queen Charlotte Islands such an event may occur somewhat oftener, say once in ten years, although there is no regular periodicity of occurrence.

Precipitation.—The Pacific Coast and Coastal Valleys have a wet season which begins approximately in the last week in September and ends about the middle of March. By contrast, there is a marked dry season in June, July, and August. The winter is mild because cold waves from the polar regions almost always traverse a broad expanse of the Pacific Ocean before impinging on the coast. The summers are generally cool because the general movement of air from the west is prevented from attaining great heat during its passage eastward over the ocean.

The heaviest precipitation occurs on the outer coast of Vancouver Island, the stretch of the mainland coast northward from Vancouver Island to the Alaskan Panhandle, as well as on the western coast of the Queen Charlotte Islands. Precipitation from October to March averages 10 to 15 inches per month. Less than

5 p.c. of this winter precipitation occurs as snowfall, except at the heads of very deep inlets on the northern stretch of the coast where it may reach 10 p.c. There are no figures available of the actual precipitation on the precipitous west coast of the Queen Charlotte Islands since there are no winter inhabitants to make the measurements but it is reported to be very heavy. The most extraordinary precipitation so far observed for a period of years has occurred at Henderson Lake which is situated at the end of an arm of Barkley Sound on the outer coast of Vancouver Island. The annual average precipitation is 262 inches and the wettest month is December which averages 47 inches. It does, however, have the characteristic dry period of the summer since June, July, and August average only 6 inches each. On the inner coast of Vancouver Island and on the islands of the Gulf of Georgia precipitation is considerably less. At higher elevations on the eastern slopes the annual precipitation is fairly high. Thus, at Cowichan Bay the annual precipitation is 34 inches but at Lake Cowichan, 550 feet higher, at the head of the Cowichan River, precipitation rises to 64 inches but averages only one inch and one-quarter per month in June, July, and August. Vancouver Island is largely mountainous and there is, therefore, a sort of 'chinook' effect on the eastern face of this mountain range. On the southeast coast of Vancouver Island the annual precipitation falls to as little as 25 inches with less than an inch in each of the months from May to August. Northward along the east coast of Vancouver Island the precipitation rises to 37 inches in the vicinity of Nanaimo and to 35 inches or slightly more on some of the islands of the Gulf of Georgia.

On the southwestern coast line the annual total is 36 inches on the outer islands of the delta of the Fraser River but the precipitation rises with small increases in elevation. The 'chinook' effect is largely lost with air currents from the west since the moist air must now ascend the Coast Mountains. Along the lower Fraser the precipitation rises to 55 or 65 inches on the comparatively flat lands alongside the River. At very moderate elevations on the mountainous slopes to the north of the Fraser the annual figure rises to the neighbourhood of 80 inches. Among the lakes north of North Vancouver, from which water for Greater Vancouver is obtained, the annual precipitation averages 100 to 150 inches and this at elevations not greatly exceeding 400 feet. The summer dry season is, however, maintained with 10 p.c. or less of the total falling in the months of June, July, and August combined. Snowfall accounts for 5 p.c. or less among these storage reservoirs but there is evidence that on considerably higher slopes which drain towards these lakes the annual percentage of snowfall may rise to 20 p.c. so that there is actually some winter storage in the form of snow to feed the reservoirs in early summer.

The following statement gives typical temperatures and precipitation of this Region:—

RANGE OF VARIATION OF JULY MEAN TEMPERATURES AT PLACES INDICATED

CHAMP DE VARIATION DES TEMPERATURES MOYENNES DE JUILLET AUX ENDROITS INDIQUE

The Northern Lands Region

The northernmost portion of the Northern Lands Region consists of islands in the polar sea. The smaller islands vary in size from mere dots on the map of the North American Continent to islands 100 to 150 miles in width. The largest island, Baffin Island, stretches from northwest to southeast more than 900 miles. Its width varies from 150 to 400 miles.

The southern portion of this Region includes the northern portion of Quebec which borders on Hudson Strait and that portion of the District of Keewatin which is bounded on the north by Queen Maud Gulf and the Gulf of Boothia. It includes also Melville Peninsula, Southampton Island, and the other islands of Hudson Strait and the northern portion of Hudson Bay. The southwestern boundary is formed by the sharp temperature-gradient of July which separates this Region from the Northwestern Lands. The mean temperature of 55°F. in July fairly well defines this boundary and orographically it is also roughly defined by the low height of land which separates the drainage of the Mackenzie Valley from that of Hudson Bay. If Koeppen's definition of 'tundra' as lands having their southern boundary along the line of 50°F. in July is accepted, those shores of Hudson Bay which lie south of the parallel of 60°N. will be omitted.

Temperature.—In these polar regions there is, of course, no regular diurnal range of temperature, from a minimum at sunrise to a maximum shortly after noon. Changes in temperature arise only from changes of airmass, the occurrence or disappearance of cloud, or fog, or the local effect of falling precipitation, deposit of rime, or circulation of moving ice. The remnants of a diurnal swing of temperature are encountered only south of the Arctic Circle. With change of airmass accompanying a south wind, at least one or two days are expected each year when the temperature rises above 65°F. in the Archipelago and 75°F. to 80°F. on the south shore of the Arctic Ocean in the west, at Coppermine. In the southern districts of Victoria Island, also, 75°F. is occasionally experienced. In winter there will be occasional calendar days with a temperature as high as 10°F. or 15°F. while not more than 5 p.c. of the time in the polar night will the temperature descend lower than 50°F. below zero.

At Chesterfield Inlet, in the most southerly portion of this Region, the average continuously frost-free period is 67 days from June 29 to September 5 but frost has occurred in July. On the southern shore of Baffin Island the frost-free period is 48 days from June 30 to August 18 but years occur in which there is frost every month of the year. On the northern shore of Baffin Island at Pond Inlet the frost-free period averages 29 days and at Resolution Island, which lies off the southeastern tip of Baffin Island, there are only 7 days, on the average, continuously free of frost. On the south shore of Hudson Strait, Cape Hope's Advance averages 21 days and in Hudson Strait, Nottingham Island averages 18 days. Towards the most northerly point of the Region, the observations at Bache Peninsula in 1931 and 1932 showed only 6 days free from frost and during the period from the late summer of 1909 to the late summer of 1910 the records at Winter Harbour, in the Parry Islands, showed only 13 days frost-free. A record made over a period of nine years at Pangnirtung at the head of an inlet on Baffin Island gives an average of 56 days frost-free.

Precipitation.—A drift of polar air of widespread extent across this area, although subject to some heating in midsummer by contact with the islands, gains temperature slowly because of contact with the ubiquitous polar waters. On

the other hand, a drift of warm air from the lands to the south across this Region may produce fog over the polar waters by rapid condensation of the water-vapour which has been transported from the south, or produce low clouds, or actual precipitation from the lifting of the warmer air over the cold wedge of polar air. The development of summer weather of the type experienced in temperate latitudes cannot, therefore, be expected.

Because of the light and fluffy nature of the snowfall, which renders measurement difficult, the total annual precipitation is not accurately known. Rainfall averages about 2 or 3 inches in the southern portion of the Archipelago, while the water-content of snow and rime may be nearly 4 inches. This total of 6 or 7 inches increases sharply near the Arctic Circle to 10 or 12 inches and to nearly 15 inches in Hudson Strait. Special snow-gauges are necessary for accurate measurement.

Flora and Fauna.—Obviously this Northern Region from the point of view of agriculture is another world where the lessons of experience in the populous regions of Canada are of no avail. It is not a land surrounded by moving ice and devoid of life and vegetation. Life abounds on land and in the water but it is a life with its own peculiar pattern. Technical information regarding the flora and fauna is limited to the reports of a few specialists who have explored this Region. Observers of the Meteorological Division of the Department of Transport have gathered notes, in addition to purely meteorological data, over a period of years which throw valuable light on a fascinating story of existence of a specialized character.

Although much of Baffin Island and of Ellesmere Island was heavily glaciated and there are glaciers still upon the mountains of northern Ellesmere Island, it is not a land of granite. Muskox and caribou can be found in all the interior valleys of Ellesmere and on the many smaller islands which suffered comparatively less from glaciation. Great flocks of birds abound in this area in summer and some types remain in the winter. Crowberries, ground-willow, sedges, and mosses grow on numerous marshes and muskegs. Muskoxen, caribou, and birds can live on these plants. The crowberries bloom and bear fruit very quickly after the Arctic night is over, despite the fact that the root-system is in very cold soil at a temperature of about 43°F. in midsummer. The roots of the sedges and prostrate willows also survive the great cold of the winter and flourish anew early in the period of perpetual sunshine. Lichens on which the muskox feeds, grow in profusion over immense areas which at first sight appear to be stretches of only broken, greyish rock but which, in effect, are pastures of vast extent in summer. In winter, these pastures are covered by light powdery snow which is easily dislodged by high winds to lay bare abundant food. To this sort of flora ordinary rules of agricultural climatology cannot be applied. In the winter the caribou and muskox will paw out the still living roots of such plants when other fodder temporarily fails.

One factor which may account for the flourishing plant and animal life in an atmosphere which averages only 42° or 43°F. in the warmest month of the year, is the comparative dryness of the atmosphere, coupled with continuous sunshine. Absorption of solar energy can raise the temperature of the superstructure of plants, lichens, and mosses much higher than that of the air. In the case of willow and crowberries, this superstructure which exhibits new growth during the polar day appears small in mass compared with the root-system below but presents a large

surface to insolation. The absorbed energy during the polar day appears sufficient to rejuvenate the root-structure to the degree necessary for its survival during the polar night. Similarly during the long period of insolation the animals build up very noticeable accumulation of fat which protects them during the winter when they live either almost constantly in water near the freezing point or alternately in the extremely cold air and the much less cold water. During the winter the fat of birds, animals, and fish noticeably diminishes. Therefore, although there is no summer comparable to that of temperate latitudes, the polar day, months-long, of the Arctic summer is a biological necessity for the continuance of polar life.

The following statement gives typical temperatures and precipitation of this Region:—

TEMPERATURES
(Fahrenheit) TOTAL PRECIPITATION

Station	Mean		Highest Lowest		Average in Inches			Average Number Days	
	Jan.	July	on Record		Jan.	July	Annual	Rain	Snow

Craig Harbour, N.W.T.....	-22.0	41.0	61	-49	0.38	0.93	9.05	17	40

The Northwestern Lands

Temperature.—The Northwestern Lands Region presents one striking feature which distinguishes it sharply from the far Northern Lands Region and the Arctic Archipelago. This is the course of the mean July temperature of 60°F. or, perhaps more correctly, of a July temperature of 57°F. or 14°C. This isotherm runs northwestward from the middle of the James Bay area north to the shore of the Arctic Ocean at the mouth of the Mackenzie River. It runs thence into central Alaska, U.S.A., returning into Yukon north of the Mount St. Elias range and down to the crest of the Rocky Mountains in Alberta.

The eastern boundary of the Northwestern Lands Region north of the 60th parallel, follows the divide between the rivers flowing eastward towards Hudson Bay and northward to the interior waters of the Arctic Archipelago. To the east of this line the temperature drops off sharply while to the west there is a very flat gradient of temperature except, of course, along the mountainous territory known as the Mackenzie Mountains with elevations of 4,000 to about 8,000 feet above sea level. Here and there in this territory, outside the mountains, spring wheat has been planted at missionary posts or posts of the Hudson's Bay Company and in some years grain of fairly good quality has matured.

The chief distinction between this Region and lands of similar latitude in Eastern Canada may be attributed to the fact that the very long hours of sunlight in the summer half-year readily warm the ground which, in turn, by conduction transfers heat to the lower layers of the atmosphere. On the other hand, in the same latitudes of the northeast the cold waters of the Arctic inlets and their extension into Hudson Bay provide a very large surface which absorbs solar radiation without much change in temperature. Outflows of polar air in summertime are, therefore, quickly warmed in the northwest but only very slowly in the northeast. The Northwestern Lands, therefore, have a distinct season of summer warmth and thus much greater agricultural possibilities than can be foreseen for the Northern Lands.

The winters are bitterly cold along the Mackenzie River, averaging 16° below to 25° below zero in January, while in Yukon Territory the winters are surprisingly mild, varying from 2° below zero in southern Yukon to 21° below zero at Dawson. In Yukon Territory a winter month may be under the influence of air modified by north Pacific waters before passing overland or, on the other hand, the invasion may be by intensely cold air of north Siberian quality, from the Beaufort Sea. The character of winter months in Yukon probably exhibits greater swings from mild to intensely cold than any other section of Canada, unless perhaps southwestern Alberta.

In summers when there has been drought on the southern Prairies the considerable load of water-vapour which has passed over the Prairies without precipitation has caused rather heavy rainfalls on these northern plains. These same wet summers show a distinct tendency to be warmer than usual with undoubtedly good growth of grains and grasses. Such years have led to considerable argument about the northern limit of wheat-growing. In favour of this argument the average length of the continuously frost-free period can be quoted but it should be kept in mind that practically all observing stations have been situated at trading posts located on waterways—the only means of access from one region to another from the earliest days. This suggests that the frost-free period would be materially shorter had the stations been situated on tablelands away from the north-flowing rivers. The deltalands of the Mackenzie River are represented by Fort McPherson and Aklavik which have average frost-free periods of 70 and 65 days, respectively: up the Mackenzie Valley there is considerable variation—Fort Norman 45 days, Fort Good Hope 52 days. Fort Resolution, on one of the great lakes of the Mackenzie, has an exceptionally long frost-free period of 93 days, Hay River, somewhat similarly situated, has 87 days, Fort Simpson 84 days but Fort Smith well down in southern territory has only 56 frost-free days. These periods represent the average interval between occurrences of the temperature of freezing point. If specially early-maturing varieties of spring wheat, which can stand a temperature three degrees below freezing without serious injury, were planted, these periods could be increased by approximately 10 p.c., and crops could be grown with more success at places along the waterways where the soil is suitable. More will be known about these possibilities in the near future since an agricultural experimental station has been established at Pine Creek in southern Yukon. Information may be obtained from the Federal Department of Agriculture on the success of trial plantings of various varieties of spring wheat at missionary stations along the Mackenzie Valley during the latest ten or fifteen years.

Precipitation.—The annual precipitation is 10 or 11 inches from the mouth of the Mackenzie to Fort Norman and rises to 13 inches at Fort Simpson and Fort Smith. Along the Athabaska River at Fort McMurray the average exceeds 17 inches but on the lower Peace River at Fort Vermilion the annual amount is about 12 inches. Of this amount about 5 inches is provided by the water-content of freshly-fallen snow. Generally, there is more than one inch of precipitation per month only from May to the end of October. The precipitation peak occurs normally in August at the northern stations and in July upriver beyond the Arctic Circle. These northern plains, therefore, have the same over-all precipitation picture as the Prairies but the summer peak is very much lower than the average of the latter. It is a peculiarity of the Great Plains of the continent that the first sharp increase of monthly precipitation begins in March in the Panhandle of Texas, U.S.A., and moves northward through the following months to reach the annual

peak in May or June in southern Alberta and June or July in southern Saskatchewan and Manitoba. Therefore, the peak recorded in August in the most northern portion of the Interior Plains appears a natural consequence of this summer monsoon effect. In Yukon the forty-year average of the annual precipitation is $12\frac{1}{2}$ inches at Dawson city, while the shorter records at Whitehorse, Aishihik, Teslin, and Snag airports do not show much variation from this figure. The average of these four airports from 1939-45, was 13 inches. Watson Lake, at the headwaters of the Liard River in the extreme southeastern portion of Yukon, shows for a ten-year record an average of nearly 16 inches. On the other hand, a thirty-one-year record at Carcross on Lake Bennett, shows slightly less than 9 inches, the reduction being common to every month of the year. Atlin, which is also on a somewhat similar lake not far distant, averages more than 11 inches; 4 to 6 inches of the annual amount being from the water-content of freshly-fallen snow. The number of days with precipitation of any sort is 4 to 7 per month from December to the following April, rising to 10 or 12 in June in Yukon and in July along the Mackenzie. The average in August is 10 to 15 days after which there is a slight drop but precipitation holds up rather well even in November.

The following statement gives typical temperatures and precipitation of this Region:—

TEMPERATURES
(Fahrenheit) TOTAL PRECIPITATION

Station	Mean		Highest	Lowest	Average in Inches			Average Number Days	
	Jan.	July			Jan.	July	Annual	Rain	Snow
	on Record								
Dawson, Y.T.....	-21.0	59.6	95	-68	0.87	1.53	12.61	63	53
Port Smith, N.W.T.....	-16.0	60.4	103	-71	0.54	2.17	13.01	51	49

The Northern Interior Valleys of British Columbia.—With the Northwestern Lands Region the Northern Interior Valleys of British Columbia might be included. Because of the comparatively high elevation of these northern valleys and their higher latitude, they have a comparatively short frost-free period which gives them a character intermediate between that of southern Yukon and the southern interior valleys of British Columbia. Meteorological observations have been made at comparatively few places in the Northern Interior Valleys but these indicate that agriculture might prove hazardous, except for cattle-ranching. The annual average temperature at Fort St. James on Stuart Lake is 35°F. and, therefore, the subsoil is not permanently frozen. The coldest month of the year averages 8°F. and the warmest month, July or August, 55° or 56°F. Taken into conjunction with an annual precipitation of approximately 15 inches, there is an indication that pastures and fodder for cattle can be maintained when settlement of the area warrants. The meteorological observations at Babine Lake and Finlay Forks support this view.

The following statement gives typical temperatures and precipitation of this area:—

TEMPERATURES

PART VII.—ASTROPHYSICS

Major astronomical work is carried on by three Canadian institutions; the Dominion Observatory, Ottawa, Ont., the Dominion Astrophysical Observatory, Victoria, B.C. (operated by the Mines, Forests and Scientific Services Branch, Department of Mines and Resources), and the David Dunlap Observatory, which is associated with the University of Toronto. Of the two Government institutions the Dominion Observatory at Ottawa has specialized mainly in the astronomy of position in solar physics, and in various branches of geophysical work, while the major effort in astrophysics has been concentrated at the Dominion Astrophysical Observatory at Victoria, B.C. The David Dunlap Observatory is a newer institution founded in 1935 with very fine astrophysical equipment of a kind similar to that in use at Victoria. It not only performs the function of a privately financed and administrated research institution but is also the nucleus of a University department of astronomy. The following article deals specifically with the work of the Dominion Astrophysical Observatory at Victoria, B.C.

THE CONTRIBUTION TO SCIENCE MADE BY THE DOMINION ASTROPHYSICAL OBSERVATORY*

The Dominion Observatory at Ottawa, Ont., was established in 1905. Its primary purpose was to provide a sound astronomical basis for the correlation of surveys, local, provincial and international boundaries, and help to solve problems of navigation and time. Western Canada was being rapidly settled at this period and the accurate determination of boundaries was a first essential.

At the turn of the twentieth century, Canada was a new and rapidly developing country. The population grew from something over 5,000,000 to nearly 9,000,000 between 1901 and 1921. Nevertheless, the Dominion sprawled over half a continent and her population was meagre indeed for the tasks ahead. The carving out of a new domain from the vast Northwest was demanding all her energies and, during the second decade of the century, the First World War called for sacrifices of manpower that could ill be spared.

Research in the realms of pure science under these circumstances had the appearance of an indulgence and a luxury, the enjoyment of which might have been postponed until the more immediate and pressing tasks were accomplished. It is the more remarkable, therefore, that the Canadian Government in those days should have shown such foresight and initiative as to support the installation of what was then the world's largest telescope and thus enable Canada to actually take the leadership in certain branches of astronomical research.

* Prepared by Dr. J. A. Pearce, Dominion Astrophysical Observatory, Victoria, B.C.

It was in 1913, just prior to the outbreak of War, that plans were drawn up for the establishment of the Dominion Astrophysical Observatory at Victoria, B.C. At first, it had been decided to establish the Astrophysical Observatory at Ottawa, but careful tests at several selected stations across Canada indicated unmistakably that Victoria had a clear advantage over all other sites in the essential conditions for the successful operation of a large reflector telescope. The magnificent 73" reflector telescope was installed in 1918, and, although it does not now hold the record for size, it is a matter of national pride that in design, construction and operating convenience, as well as accuracy, the telescope in the Dominion Astrophysical Observatory is not, even to-day, excelled by any instrument in the world.

Dr. J. S. Plaskett was the founder of the Astrophysical Observatory and its first Director from 1917 to 1934. It was he who gave special attention to the design of the special spectrograph at the Observatory. This instrument complemented the work of the telescope and was among the best and most powerful in operation anywhere.

It is particularly in the field of stellar motions and the researches connected with them that a large reflector telescope is essential, for the only method of obtaining measurable spectra of faint stars is to use the fastest photographic plates, the largest possible telescope to make the stellar images more intense, and to make possible shorter exposures. Other smaller instruments are capable of carrying out some other important astronomical work quite as efficiently as a large telescope. It is for this reason that, from its installation, the 73" reflector in the Victoria Observatory has been used almost exclusively for spectrographic work and during the past twenty-nine years, a total of 38,000 spectra has been secured.

Since the establishment of the Observatory three decades ago, the number of known stellar radial velocities has increased from a few hundred to approximately 12,000. Of this total, the Victoria Observatory has contributed about 25 p.c., a very creditable contribution considering the small size of the staff.

Under the enthusiastic direction of Dr. Plaskett and his successors, the Dominion Astrophysical Observatory has taken its full share in formulating a policy of co-operation with other countries and in carrying out broad programs of research and co-ordinating results on a world basis. Each observatory while working according to a general plan carries out individual researches that, instead of overlapping, are tied in with those of other observatories to the general benefit of science as a whole.

It is difficult for the ordinary citizen to realize just how an abstract science like astronomy links in with the practical problems of day-to-day existence. But astronomy, as well as being the oldest science, is in some respects the most fundamental. As a branch of astronomy, astrophysics is concerned with the determination of the structure of the universe—the constitution and mode of evolution of the stars. The scientist follows the quest for truth for its own sake, but it must be remembered that the pure science of to-day is the applied science of to-morrow. Technicians and industrial scientists eagerly seize upon the discoveries achieved by pure science and lose no time in turning them to practical account, with results that are often of immense economic value. For instance, the apparently useless investigations of Faraday into the effects of magnets and electric currents on one another led to the generation and universal use of cheap electricity. Nothing in the realm of pure science is unimportant or unworthy of the scientist's attention: radio, radar, television, atomic energy and all the amazing sequence of discoveries

that have marked the past quarter century have resulted from the curiosity of scientists whose conscientious labours were directed to nothing more than opening up to exploration new paths into the unknown. The two Canadian Government Observatories were among the earliest national scientific institutions in the Dominion. They established Canada's name in the scientific world and have added greatly to her laurels as the years have passed. Under the following headings, the main avenues of research developed in the Dominion Astrophysical Observatory are summarized. In the space available here, however, it is possible to do no more than touch upon their scope.

Stellar Motions.—The first large piece of work undertaken by the Dominion Astrophysical Observatory was the study of the motions of the stars. In the first three and a half years of its existence the Observatory at Victoria measured the speed towards the earth (technically called the radial velocity) of 600 stars as compared with about 2,000 determined previously at all other observatories. Since then, the proportion calculated by the Dominion Astrophysical Observatory has increased owing to the facilities and skills developed for this type of work at Victoria.

A solid reputation was built up by this institution which was evidenced among other ways by the award to the first Director, Dr. Plaskett, of a Fellowship in the Royal Society in 1924. The study of stellar motions is undertaken in order to understand the construction of the sidereal universe and the forces which govern the movements of the stars. Observations of the accurate positions of the stars in the sky have been carried on for over a century and are still being assiduously determined. These observations of position when repeated twenty, fifty or more years later serve to determine the transverse components of the stellar motion, expressed by the small angular displacement across the sky in a year or a century. Because of the great distances of the stars these angles are excessively minute varying from immeasurably small quantities, one or two thousandths of a second of arc for the distant stars to about five seconds of arc for a few of the nearby stars. To-day, these angular speeds (technically called "the proper motions") for about 35,000 stars are known but they have to be supplemented by the radial or line-of-sight components before the actual translational motion of the stars can be determined. Unless the radial components and the distances of the stars, as well as the transverse components, are known, neither the space velocities nor the actual directions in space of the stellar motions can be determined, and our knowledge is too incomplete to give a true picture of the structure of the stellar universe.

The Rotation of the Galaxy.—The most stupendous of all celestial masses is the Galaxy—more commonly known as the Milky Way. Its appearance as a dim white band across the heavens marks only the plane of greatest extension—the direction in which the stars appear congested due to distance. The hidden mysteries of the Galaxy are the key to "the riddle of the universe".

Through the studies of stellar motions, explained under the previous heading, scientific thinking has been influenced and knowledge of the dynamics and dimensions of the stellar universe increased.

An extensive survey of the relatively rare and distant high temperature stars was completed by J. S. Plaskett and J. A. Pearce in 1930; approximately six years of observing being required to secure more than 3,000 spectrograms of these stars. A critical analysis of the spatial distribution and motions of 850 stars for which

reliable proper motions and accurate radial velocities existed gave the first conclusive evidence from observational data that the great stellar system was in rotation as postulated by Lindblad and Oort. This important research convincingly demonstrated that the sun and the local cluster of stars were describing Keplerian ellipses in the plane of the Galaxy, about a dynamical centre, 30,000 light years distant in galactic longitude 324° , in the direction of the constellation Sagittarius. The diameter of the stellar system was found to be 100,000 light years; the orbital velocity of the sun 275 kilometres per second; and the period for one complete revolution 224,000,000 light years. The observed stellar velocities gave a value of $1.6 \text{ by } 10^{11}$ suns (160,000,000,000 suns) as the mass of the Galaxy approximately one-half being due to the 100,000,000,000 lucid stars of the system and one-half attributed to the extensive cloud of dark interstellar matter highly condensed in the galactic plane.

This interesting and highly important investigation provided an accurate and independent determination of the form, dimensions and dynamical constants of the Galaxy, and stimulated many studies of galactic structure in subsequent years. A systematic survey of some 700 fainter and more distant high temperature stars is currently being conducted by J. A. Pearce and R. M. Petrie, to study in greater detail stellar movements in various parts of the Galaxy. At the same time, regions nearer the sun are being investigated in order that an understanding of the dynamics of the Galaxy may, ultimately, be attained. In addition, dynamical studies are being made of special groups of stars, such as the Taurus Cluster, the Pleiades, and the Ursa Major Cluster. Fundamental work goes on in the study of wave-length standards and control stars in order that the highest possible accuracy be achieved in velocity results. With highly developed facilities for radial velocity work, the Observatory is making permanent and important contributions in the field of stellar dynamics.

Binary Stars.—The observation and study of binary stars is an important branch of modern astronomy, for such systems present an opportunity of studying the operation of gravitational forces outside the solar system. Moreover, these binary systems provide the only sure knowledge (except for the sun) about the masses, diameters, and densities of stellar bodies. Many of them have components so close together that they can never be resolved telescopically but are discovered by spectroscopic observations. Their binary character is revealed by a periodic variation in radial velocity as the stars revolve in their orbits. Such close systems, called spectroscopic binaries, are of great interest because, from an analysis of the orbital motion, the masses, radii, and other dimensions, of the component stars may frequently be determined.

The spectroscopic work at Victoria has resulted in the discovery of many spectroscopic binaries. At present, a total of more than 1,500 systems of this class is known and about one-third of these were discovered at the Dominion Astrophysical Observatory. Moreover, the Observatory has taken a prominent part in the detailed observation and calculation required to deduce orbital elements. The most recent catalogue (1936) lists determined orbits for 375 spectroscopic binaries and names this Observatory as the authority in 116 cases. The late Dr. William E. Harper devoted over 30 years to orbit work and computed the orbital elements of nearly 100 systems, twice as many as any other astronomer.

Emphasis has been placed upon the binaries composed of high temperature stars with the result that 70 p.c. of the most massive stars known to science were discovered and studied here. Outstanding contributions in this important field have

been made by W. E. Harper, J. S. Plaskett, J. A. Pearce, R. M. Petrie, and R. K. Young. The study of spectroscopic binaries continues with new discoveries being added in the prosecution of radial-velocity programs. Attention now is directed to detailed studies of particularly interesting systems. Thus, the only reliable data on the radii and masses of a strange class of sub-luminous stars are provided by orbital studies made at Victoria. Recently, a method has been devised and applied by R. M. Petrie whereby the relative brightness and dimensions can be found entirely from spectrophotometric investigations of double stars.

Determination of Stellar Distances.—The most exacting observational task in astronomy is to determine the distances to the stars. This knowledge is required to describe and understand the universe. For all but the nearest stars direct trigonometric methods are quite inadequate, although adaptations of such methods are used. Naturally, the base line must be of enormous length where astronomic distances are concerned. The one that best serves the purpose is the diameter of the earth's orbit about the sun (186,000,000 miles). Close co-operation of observatories in Europe, America, and other parts of the world are required for the determination and checking of such distances. Fortunately, spectroscopic studies have allowed estimates of the intrinsic brightness of stars and so find their distances from Earth. An extensive study at this Observatory, by W. E. Harper and R. K. Young, of the spectra of stars resembling our sun culminated in 1922, in the publication of the distances and true brightnesses of over 1,100 stars, an important contribution to the subject. At the present time efforts are being made to apply the principle to the high temperature stars and to discover spectroscopic criteria of luminosity. There is good reason to believe that, in the near future, reliable values may be obtained of the distances of the high temperature stars in remote parts of the Galaxy.

Studies of Interstellar Matter.—The contribution of the Dominion Astrophysical Observatory to the scientific study of the nature of the material universe and the structure of matter has been of far greater importance than is often realized.

A number of important researches at Victoria have added greatly to knowledge of the tenuous matter in the vast spaces between the stars. It had long been known from the pioneer surveys of the Milky Way by the Herschels, by Barnard, Seeliger and other astronomers of the last century that an extensive cosmic cloud pervaded the Galaxy. The diffuse galactic nebulae are visual evidences of this cloud, while the large irregular dark patches in the Milky Way unquestionably indicate the presence of extensive clouds of dust particles which redden and frequently occult the light of the more distant stars.

The nature of this interstellar matter was literally a dark mystery until two decades ago when spectrographic studies, principally at Victoria, revealed its true character. It was clearly shown by Dr. J. S. Plaskett, in 1924, that the strong and unusually narrow absorption lines of sodium and ionized calcium which he observed in the spectra of 50 distant O-type stars originated in a diffuse gaseous medium relatively at rest with respect to the stellar system. This investigation undoubtedly was the foundation for Eddington's theoretical discussion of diffuse matter in space. This theory was fully confirmed by a later research of Plaskett and Pearce on the motions and distributions of interstellar matter in the direction of over 260 high temperature stars. The interstellar calcium atoms were found to share in the general galactic rotation, and statistically, at least, were fairly uniformly distributed throughout the stellar system. A further result gave a direct relation

between the estimated intensities of the interstellar lines and the distance of the star, thus providing a new method of obtaining the individual parallaxes of these distant stars. A single-prism spectrograph giving moderate dispersion was employed in the above mentioned investigations as, with few exceptions, these distant stars are quite invisible to the unaided eye.

A few years later, Dr. C. S. Beals, now Dominion Astronomer, using a three-prism spectrograph found that the interstellar calcium and sodium lines in some stars had multiple structure. The results were extremely interesting and important as they showed that the interstellar matter, instead of being uniformly distributed was actually organized into a number of discrete clouds with individual motions in the line-of-sight. His work has been recently confirmed by Dr. W. S. Adams at the Mount Wilson Observatory, California, U.S.A., using the most powerful astronomical spectrograph in existence.

Whereas formerly, the strengths of the interstellar lines were estimated in a relative scale of intensities, quantitative measurements of the intensities of the interstellar lines have recently been made by Dr. Beals using a registering microphotometer, designed by him and constructed by the instrument maker of the Observatory. These have been used in studies correlating the intensities of interstellar lines and the distances of the stars in whose spectra they appear.

An important contribution to our knowledge of interstellar matter was recently made by Dr. McKellar who showed that certain unidentified interstellar lines were due to the molecular compounds CN and CH, thereby establishing the existence of diatomic molecules in space. This discovery followed from an exhaustive analysis of the band spectra of 30 diatomic molecules. The data permitted the computation of the effective temperature of interstellar space as 1° absolute, and established the interesting fact that because of the extremely low temperature and pressure in space all the electrons in the molecules were concentrated in the lowest energy states. Thus, the spectrum of an interstellar molecule consists solely of a single resonance line, in striking contrast to the complex banded spectrum observed under laboratory conditions.

Studies of the Physical Characteristics of the Stars, Nebulae and Comets.—In the earlier years of the Observatory's history nearly all the researches undertaken were in the field of dynamical astronomy, but in recent years problems relating to the physical conditions in stellar atmospheres, the nebulae and comets have received steadily increasing attention. At the present time at least one-half of the total research deals with subjects in this general field. In this short article it is not possible, nor desirable, to outline the theories behind the interpretation of stellar spectra. It is sufficient to state that the positions, intensities and characteristics of the emission features and absorption lines appearing in the stellar spectra, when analysed by a microphotometer give definite information on the physical conditions in the heavenly bodies.

A new method of determining stellar temperatures was developed by H. H. Plaskett with interesting applications. Using carefully controlled lamps and carbon arcs as standard sources and a neutral-tint wedge before the spectrograph to vary the amount of light transmitted, he was able to determine the distribution of energy in different parts of the spectra of various astronomical sources including the sun, several stars and nebulae. This research is regarded as one of the pioneer investigations of stellar spectrophotometry, a field which has recently become increasingly important.

Classification of the O- and B-type Stars.—By a careful analysis of the spectra of three high temperature O-type stars, H. H. Plaskett demonstrated that the atomic constants in these very hot stars were identical with those determined in terrestrial laboratories. This observation and identification of faint spectral lines of ionized helium, two angstroms to the violet of the hydrogen lines, predicted from theory but not previously identified in the stars was a splendid verification of Bohr's theory of the atom.

The O-type stars were shown to have temperatures ranging from 22,000°K for O5 to 15,000°K for O9 stars and new spectral criteria for the classification of the O-type stars were proposed and adopted by the International Astronomical Union.

A careful reclassification of over 1,000 O- and B-type stars was subsequently carried out by J. S. Plaskett and J. A. Pearce who estimated the relative intensities of the spectral lines by means of a standard scale. This revision arranged these stars whose temperatures vary from 30,000°K to 10,000°K in a better linear sequence than the previously published Harvard Classification. Recently, Dr. R. M. Petrie has measured the intensities of many spectral lines in a number of these stars, with the microphotometer, thus providing quantitative impersonal measures in place of the visual estimates previously adopted. From theoretical considerations he finds excitation temperatures of 36,300°K to 28,600°K for the O5 and B0 stars.

Investigations of the Emission Line Stars: The Wolf-Rayet Stars.—Dr. C. S. Beals joined the Observatory staff in 1927 and undertook as a special research the investigation of the Wolf-Rayet stars, north of declination -24 , all that could be observed from Victoria. These stars are extremely hot, and their spectra showing strange broad emission bands of unknown origin were, at that time, quite unexplained. A satisfactory classification of the Wolf-Rayet stars into two main sequences, (a) the Nitrogen and (b) the Carbon sequence, was proposed and adopted by the International Astronomical Union. Stars of the nitrogen sequence are characterized by emission bands due to nitrogen to the exclusion of carbon while the carbon sequence shows bands due to carbon and oxygen to the exclusion of nitrogen.

Spectrophotometric studies of the contours of the emission bands, in both the visual and photographic regions led Dr. Beals to advance the hypothesis that these wide bands were produced by atoms being constantly ejected with velocities as high as 3,000 kilometres per second from the stellar surfaces. This theory satisfactorily explains the observed features and has been universally accepted. Thus, the major mysteries of these strange stars have been solved. Accurate information on the absolute magnitudes, masses, diameters, and parallaxes of these stars is much to be desired.

The P-Cygni Stars.—In the 17th century a new star appeared in the constellation of Cygnus which, unlike other novæ is still visible to the unaided eye as a star of the fourth magnitude, and which has been designated P-Cygni. This star is the prototype of a small group of early type stars whose spectra are characterized by complex features consisting of emission lines bordered on their violet edges by absorption components. Following a detailed spectrographic study of P-Cygni, Dr. Beals secured observations of all P-Cygni-like objects that could be observed at Victoria and has made extensive studies of the profiles of the strange spectral features. This work has led to important conclusions concerning the motions and stratification within the atmospheres of these stars. A comprehensive catalogue describing in detail the classification, spectra, light variations and physical characteristics of these stars is almost ready for the press.

Studies of Solar Type Stars.—Dr. K. O. Wright recently completed an important research which added greatly to knowledge of stellar atmospheres. Using the most powerful spectrograph at Victoria he observed a number of giant and dwarf stars similar in spectral type to our sun. Detailed measurements of the positions and intensities of over 600 lines in the spectrum of each star were made, from which data, curves-of-growth relating the intensities of the absorption lines to the number of atoms active in forming them were constructed. Values of the excitation temperatures, electron pressures, chemical composition and other properties of the stellar atmospheres were deduced. Important results on the thermal equilibrium, or lack of it, in these stars were obtained. These accurate stellar observations indicate the great need for more laboratory measurements of spectral lines since the theory of line intensities is still incomplete.

Studies of the R- and N-type Stars.—In recent years, a systematic survey of approximately 50 of the red giant stars of spectral R- and N-types has been carried out by Dr. Andrew McKellar with interesting results. These stars are among the coolest stars known and their spectra show progressions of bands due to molecular compounds of carbon. Detailed spectrophotometric measurements of the complex bands have enabled Dr. McKellar to distinguish the two different isotopes of carbon C^{12} having atomic weight 12, and C^{13} having atomic weight 13. On Earth, the abundance ratio of C^{12} to C^{13} is 90 to 1, and it is very important to determine this ratio in stellar sources. A few of the 21 R-type stars investigated have the ratio C^{12} to C^{13} of over 50 to 1, but the majority give the surprising value of this ratio of 3 to 1. The results indicate that these stars may be subdivided into two "age" groups a discovery having an important bearing upon theories of stellar evolution and the energy production in stars. A similar study is in progress for 25 red giant N-type stars.

The highly important result of the above survey was the identification of the resonance line of lithium, $\lambda 6707$ in the faint red star WZ Cassiopeiae. Lithium is a common element on the earth, and its presence in the sun is shown by a faint line in the solar spectrum: previous to this discovery it was not known in stellar sources. Dr. McKellar's subsequent observations showed that only a few of the coolest of these rare red giants have small amounts of lithium in their atmospheres, so presumably, the cosmic abundance of this element is very low.

Investigations of Cometary Spectra.—Only three comets have been bright enough to be observed spectrographically from Victoria, during the past ten years. Using a spectrograph of moderate dispersion, spectra of the highest spectral purity were secured of comet Whipple II, 1942g, which for the first time, resolved the cyanogen band $\lambda 3883$ into lines. From a study of the structure of this band Dr. McKellar was able to show that the mechanism giving rise to the emission bands characteristic of cometary spectra is that of resonance-fluorescence by the primary solar radiation. Thus, a fifty-year mystery was satisfactorily explained. It is of interest to state that the same explanation was independently advanced in the same week by McKellar of Victoria, Minkowski of Mount Wilson, and Swings of Chicago. Subsequently, a joint paper on this subject was published by these astronomers, an example of the spirit of co-operation, and competition, that exists in astrophysical research.

Assistance of Observatory Personnel to the War Effort.—During the war years, 1939-45, all members of the staff made valuable contributions to the national war effort. Dr. A. McKellar, M.B.E., and Dr. R. M. Petrie, M.B.E.,

served for two years with the Royal Canadian Navy on Operational Research associated with the anti-submarine warfare in the Atlantic. Dr. C. S. Beals, as Provincial Gas Officer, devoted approximately three years to a study of Civilian Defence against poison gas. Mr. W. H. Stilwell assisted the Geodetic Service in an important war project, in the survey of new air fields in the Hudson's Bay area. The Director, Dr. J. A. Pearce, served for two years as an instructor in the Royal Canadian Artillery. Accurate time was furnished daily to the Air Force, and many technical instruments for all branches of the Armed Forces were repaired in the Observatory workshop. Notwithstanding their various war effort activities, the reduced staff maintained the photographic work with the seventy-three-inch telescope at normal efficiency, and a total of 8,000 spectra was secured during these years.

The outstanding development of science in the 20th century has been the increase in knowledge about atoms, especially the discovery of the secret of atomic fission. Many years ago, at the Dominion Astrophysical Observatory, examination into the mass of the electron was made from studies of the spectrum of certain very hot stars and the homogeneity of matter throughout the universe was proved. By close collaboration between physicists and astronomers this present comprehensive knowledge of the structure of matter has been slowly built up. It is this knowledge that has provided the basis of many modern inventions—radio, the electrical reproduction of the human voice, radar, the use of infra-red and other rays, etc. Thanks largely to purely astrophysical investigations, the world is now entering upon a new era with vastly increased resources at its command.

PART II.—CHRONOLOGY

NOTE.—Events in the General Chronology from 1497 to 1866 are given at pp. 46-50 of the 1947 Year Book. The Ministries and the dates of elections and lengths of sessions of Dominion Parliaments are given in Tables 2 and 5, respectively, of Chapter III. Changes in Provincial Legislatures and Ministries from Confederation to 1923 are given at pp. 75-84 of the 1924 Year Book, from 1924 to 1937 at pp. 110-118 of the 1938 Year Book and from 1934-48 in Tables 13-21, pp. 104-115 of this edition. References regarding these matters are not given in this Chronology.

1867. Mar. 29, Royal Assent given to the British North America Act. July 1, The Act came into force; Union of the Province of Canada, Nova Scotia and New Brunswick as the Dominion of Canada; Upper and Lower Canada made separate provinces named Ontario and Quebec; Viscount Monck, first Governor General; Sir John A. Macdonald, Prime Minister. Nov. 6, Meeting of the first Dominion Parliament.
1868. Apr. 7, Murder of D'Arcy McGee at Ottawa. July 31, The Rupert's Land Act authorizing the acquisition by the Dominion of the Northwest Territories.
1869. June 22, Act providing for the government of the Northwest Territories. Nov. 19, Deed of surrender to the Crown of the Hudson's Bay Company's territorial rights in the Northwest. Outbreak of the Red River Rebellion under Riel.
1870. May 12, Act to establish the Province of Manitoba. July 15, Northwest Territories transferred to the Dominion and Manitoba admitted into Confederation. Aug. 24, End of Red River Rebellion.
1871. Apr. 2, First Dominion Census (population 3,689,257). Apr. 14, Act establishing uniform currency in the Dominion. May 8, Treaty of Washington signed. July 20, British Columbia entered Confederation. Dominion undertook to begin construction of a transcontinental railway within two years and to complete it within ten years.
1872. Canadian Pacific Railway general charter passed by the Dominion Parliament authorizing construction of a transcontinental line by a private company.
1873. May 23, Act establishing the North West Mounted Police. July 1, Prince Edward Island entered Confederation. Nov. 8, Incorporation of Winnipeg.
1874. May 26, The Dominion Elections Act. May, Ontario Agricultural College, Guelph, opened.

The government of Canada is provided for by the British North America Act of 1867.* This Statute of the Imperial Parliament, as from time to time amended, forms the written basis of the constitution of Canada. Subsequent sections of this Chapter describe the processes by which the constitution has developed and the institutions, as at present constituted, by which Canada is governed.

The several stages in the development of the status of the Dominion have been authoritatively described in the reports of successive Imperial Conferences including that held at London in 1926, which defined the group of self-governing communities consisting of the United Kingdom and the Dominions as "autonomous communities within the British Empire, equal in status, in no way subordinate one to another in any aspect of their domestic or foreign affairs, though united by a common allegiance to the Crown and freely associated as members of the British Commonwealth of Nations". That Conference also recognized that, as a consequence of this equality of status, the Governor General of a Dominion "is the representative of the Crown, holding in all essential respects the same position in relation to the administration of public affairs in the Dominion as is held by His Majesty the King in Great Britain", and that "it is the right of the Government of each Dominion to advise the Crown in all matters relating to its own affairs". Simultaneously, with this change in the constitutional relationship between the several parts of the British Commonwealth of Nations, there developed, as a complementary aspect of nationhood, the assumption by the several Dominions of further responsibilities and rights of sovereign States in their relations with other members of the community of nations. Membership in the League of Nations and, more recently in the United Nations, the exercise of treaty-making powers and the establishment of separate diplomatic representation in a number of foreign countries have characterized this phase in the growth of Canada. More explicit recognition of the implications of the

* See pp. 40-60 of the 1942 Year Book for text of the original B.N.A. Act and notes regarding amendments and modifications thereto.

principles of equality of status was accorded in the Statute of Westminster of 1931, which provided for the removal of the remaining limitations on the legislative autonomy of the Dominions.

Thus, Canada has, under the Crown, equality in status with Great Britain and the other Dominions in both domestic and foreign affairs; its government advises the Crown in the person of the Governor General on all matters relating to Canada; it has membership in the United Nations Organization; makes its own treaties; appoints its own ambassadors and other representatives abroad; levies its own taxes; makes its own laws which are executed by a government dependent on the will of a majority of the Canadian people; and maintains its own military, naval and air forces. In short, Canada has achieved the full status of democratic nationhood within the British Commonwealth of Nations.

PART I.—THE CONSTITUTION AND GENERAL GOVERNMENT OF CANADA

The two basic characteristics of the Canadian constitution are that it is federal and that, apart from the federal aspect, it is modelled closely on the British Parliamentary System.

Federation occurred in 1867 with the union of three colonies, Nova Scotia, New Brunswick, and Canada, which was divided into two provinces, Ontario and Quebec. The colony of British Columbia joined in 1871 and Prince Edward Island in 1873. Three other provinces were created out of Hudson's Bay Company lands acquired in 1868: Manitoba in 1870, Saskatchewan and Alberta in 1905.

The federal aspect of the constitution is defined by the British North America Act, 1867, and amendments. This Act divides the field of legislative and executive power between national and provincial authorities. It provides also the legal framework for national and provincial political institutions, but leaves the provinces full discretion to amend their own constitutions except with respect to the office of Lieutenant-Governor, the formal head of provincial government, and except that no provincial legislative authority may invade the field allotted by the Act to the Parliament of Canada.

The British North America Act must, however, be understood in the light of law, custom and the British constitution. Representative institutions were deeply rooted in the colonies before federation, and responsible (or cabinet) government had become the accepted practice in the maritime colonies and Canada. The British North America Act omits all reference to the cabinet system or the conventions under which it operates; the Act simply assumes that the cabinet system will obtain in both the national and provincial field. This has been the case, although modifications of British practice have been introduced to meet local conditions.

Section 1.—The Evolution of the Constitution Down to Confederation

The process of the development of free government in the Dominion of Canada down to Confederation is given in an article appearing at pp. 34-40 of the 1942 Year Book. Also in an Appendix to that article, pp. 40-60, the text of the British North America Act is presented.

Section 2.—The Development of the Constitution Since Confederation

A specially prepared article bringing the developments since Confederation up to date is published at pp. 41-47 of the 1943-44 Year Book. See also list of Special Articles under "Constitution and Government" at the beginning of this volume.

PART II.—ORGANIZATION

Section 1.—Federal Government

The Dominion Parliament is composed of the King (represented by the Governor General), the Senate and the House of Commons. As a result of the working out of the democratic principle, the part played by the King's representative and the Upper Chamber of Parliament in the country's legislation has been, in Canada as in the United Kingdom, a steadily decreasing one, the chief responsibilities involved in legislation being assumed by the House of Commons.

Subsection 1.—The Executive

The Governor General.—The Governor General is appointed by the King as his representative in Canada, usually for a term of five years. He is bound by the terms of his commission and instructions and can exercise only such authority as is expressly entrusted to him. He acts under the advice of his Ministry, which is responsible to Parliament, and, as the acting head of the Executive, summons, prorogues and dissolves Parliament, and assents to or reserves bills. New Letters Patent came into force on Oct. 1, 1947, whereby it is legally possible for the Governor General, on the advice of Canadian Ministers, to exercise any of the powers and authorities of the Crown in respect of Canada, without the necessity of a submission being made to the King.

Salary and Allowances.—The Governor General receives a salary of £10,000 per annum, which is a charge against the consolidated revenue of the country. He also receives \$50,000 annually as an allowance for travelling.

1.—Governors General of Canada, 1867-1948

Name	Date of Appointment	Date of Assumption of Office
VISCOUNT MONCK, G.C.M.G.	June 1, 1867	July 1, 1867
LORD LISGAR, G.C.M.G.	Dec. 29, 1868	Feb. 2, 1869

The MARQUIS OF LANSDOWNE, G.C.M.G.	Aug. 18, 1883	Oct. 23, 1883
LORD STANLEY OF PRESTON, G.C.B.	May 1, 1888	June 11, 1888
The EARL OF ABERDEEN, K.T., G.C.M.G.	May 22, 1893	Sept. 18, 1893
The EARL OF MINTO, G.C.M.G.	July 30, 1898	Nov. 12, 1898
EARL GREY, G.C.M.G.	Sept. 26, 1904	Dec. 10, 1904
FIELD MARSHAL H.R.H. The DUKE OF CONNAUGHT, K.G.	Mar. 21, 1911	Oct. 13, 1911
The DUKE OF DEVONSHIRE, K.G., G.C.M.G., G.C.V.O.	Aug. 19, 1916	Nov. 11, 1916
GENERAL The LORD BYNG OF VIMY, G.C.B., G.C.M.G., M.V.O.	Aug. 2, 1921	Aug. 11, 1921
VISCOUNT WILLINGDON OF RATON, G.C.S.I., G.C.I.E., G.B.E.	Aug. 5, 1926	Oct. 2, 1926
The EARL OF BESSBOROUGH, G.C.M.G.	Feb. 9, 1931	Apr. 4, 1931
LORD TWEEDSMUIR OF ELSFIELD, G.C.M.G., G.C.V.O., C.H.	Aug. 10, 1935	Nov. 2, 1935
MAJOR-GENERAL The EARL OF ATHLONE, K.G., P.C., G.C.B., G.C.M.G., G.C.V.O., D.S.O.	Apr. 3, 1940	June 21, 1940
FIELD MARSHAL The RIGHT HONOURABLE VISCOUNT ALEXANDER OF TUNIS, K.G., G.C.B., G.C.M.G., C.S.I., D.S.O., M.C., LL.D., A.D.C.	Aug. 1, 1945	Apr. 12, 1946

The Ministry.—Canada's system of government is based upon that of the British, by which a Cabinet or Ministry (composed of members of the House of Commons or the Senate) is responsible to Parliament. The Cabinet is actually a committee of the King's Privy Council for Canada. Without enlarging upon the features of the system, it may be sufficient to note that the Cabinet is responsible to the House of Commons and, following established precedent, resigns office when it becomes evident that it no longer holds the confidence of the people's representatives. Members of the Cabinet are chosen by the Prime Minister; each generally assumes charge of one of the various Departments of Government, although a Minister may hold more than one portfolio at the same time, or may be without portfolio.

2.—Prime Ministers Since Confederation

Ministry	Prime Minister	Length of Administration
1	Rt. Hon. Sir JOHN ALEXANDER MACDONALD.....	July 1, 1867 - Nov. 5, 1873
2	Hon. ALEXANDER MACKENZIE.....	Nov. 7, 1873 - Oct. 16, 1878

¹ The ordinary legal limit of duration for each Parliament is five years. ² Duration of Parliament in years, months and days. The life of a Parliament is counted from the date of return of election writs to the date of dissolution, both days inclusive (B.N.A. Act, Sect. 50). ³ Date of general election. ⁴ Writs returnable. ⁵ Dissolution of Parliament. ⁶ During the war years Parliament was kept in almost continuous session. When prorogation took place it was followed immediately by a new session. During long adjournments provision was made whereby the Speaker could reconvene Parliament before the date previously set for reassembly.

Subsection 2.—The Legislature

The Senate.—From an original membership of 72 at Confederation, the Senate, through the addition of new provinces and the general growth of the Dominion, now has 96 members, the latest change in representation having been made in 1915. The growth of representation in the Senate is traced at pp. 47-49 of the 1940 edition of the Year Book and is summarized, by provinces, in Table 6.

6.—Growth of Representation in the Senate, 1867-1948

The House of Commons.—In Section 37 of the British North America Act of 1867 (30 Vict., c. 3) it was provided that "The House of Commons shall, subject to the provisions of this Act, consist of one hundred and eighty-one members, of whom eighty-two shall be elected for Ontario, sixty-five for Quebec, nineteen for Nova Scotia, and fifteen for New Brunswick". Further, under Section 51, it was enacted that, after the completion of the Census of 1871 and of each subsequent decennial census, the representation of the four provinces should be readjusted by such authority, in such manner, and from such time, as the Parliament of Canada provided, subject to and according to certain rules set out in the original Act.

The representation of the provinces in the Dominion Parliament as at 1867 and the readjustments that took place with the admission of the newer provinces into Confederation and with each decennial census up to 1931, are outlined at pp. 57-59 of the 1946 Year Book. The number of representatives of each province elected at each of the 20 general elections since Confederation is given in Table 8.

Redistribution of Parliamentary Constituencies, 1947.—After the completion of the 1941 Census the redistribution required by the British North America Act following each decennial census was postponed. A resolution to that effect was presented to Parliament and forwarded to London in the form of an Address to His Majesty the King. His Majesty caused a Bill to be laid before the Parliament of the United Kingdom for the enactment of the provisions of the resolution; this was duly passed through all stages by July 22, 1943. The Bill provided that "notwithstanding anything in the British North America Acts, 1867 to 1940, it shall not be necessary that the representation of the provinces in the House of Commons be readjusted, in consequence of the completion of the decennial census taken in the year One Thousand Nine Hundred and Forty-One, until the first session of the Parliament of Canada commencing after the cessation of hostilities between Canada and the German Reich, the Kingdom of Italy and the Empire of Japan". During the first session of the Twentieth Parliament, the House of Commons and the Senate of Canada petitioned the Imperial Government, requesting an amendment to Section 51 of the British North America Act. As a result, that Section of the Act was repealed and the following substituted therefor:—

- "(1) The number of members of the House of Commons shall be Two hundred and fifty-five and the representation of the provinces therein shall forthwith upon the coming into force of this section and thereafter on the completion of each decennial census be readjusted by such authority, in such manner, and from such time as the Parliament of Canada from time to time provides, subject and according to the following Rules:
- (a) Subject as hereinafter provided, there shall be assigned to each of the provinces a number of members computed by dividing the total population of the provinces by Two hundred and fifty-four and by dividing the population of each province by the quotient so obtained, disregarding, except as hereinafter in this section provided, the remainder if any, after the said process of division.
 - (b) If the total number of members assigned to all the provinces pursuant to Rule One is less than Two hundred and fifty-four, additional members shall be assigned to the provinces (one to a province) having remainders in the computation under Rule One commencing with the province having the largest remainder and continuing with the other provinces in the order of the magnitude of their respective remainders until the total number of members assigned is Two hundred and fifty-four.
 - (c) Notwithstanding anything in this section, if upon completion of a count under Rules One and Two, the number of members to be assigned to a province is less than the number of senators representing the said province, Rules One and Two shall cease to apply in respect of the said province, and there shall be assigned to the said province a number of members equal to the said number of senators.
 - (d) In the event that Rules One and Two cease to apply in respect of a province then, for the purpose of computing the number of members to be assigned to the provinces in respect of which Rules One and Two continue to apply, the total population of the provinces shall be reduced by the number of the population of the province in respect of which Rules One and Two have ceased to apply and the number Two hundred and fifty-four shall be reduced by the number of members assigned to such province pursuant to Rule Three.
 - (e) Such readjustment shall not take effect until the termination of the then existing parliament.
- "(2) The Yukon Territory as constituted by c. 41 of the Statutes of Canada, 1901, together with any part of Canada not comprised within a province which may from time to time be included therein by the Parliament of Canada for the purposes of representation in parliament, shall be entitled to one member."

Accordingly, by the Representation Act, 1947 (c. 71, Statutes of 1947) the total membership in the House of Commons was increased from 245 to 255. The representation of Quebec was increased from 65 to 73, of Ontario from 82 to 83, of Nova Scotia from 12 to 13 and of British Columbia from 16 to 18. New Brunswick,

Prince Edward Island, Alberta and Yukon remained the same at 10, 4, 17 and 1, respectively, while Manitoba and Saskatchewan each lost one, having 16 and 20 members, respectively, by the new Act.

Indemnities and Allowances.—Members of the Senate receive a sessional indemnity of \$4,000. In addition, they receive an annual expense allowance of \$2,000, paid at the end of each calendar year. Members of the House of Commons are paid a sessional indemnity of \$4,000. In addition, they receive \$2,000 as an annual expense allowance, paid at the end of each calendar year. This allowance, except in the case of Ministers of the Crown and the Leader of the Opposition, is not subject to income tax.¹ The remuneration of a Cabinet Minister is \$10,000 a year, the Prime Minister receiving \$15,000, in addition to the sessional indemnity each receives as a Member of Parliament. The Leader of the Opposition also receives \$10,000 a year in addition to his sessional indemnity. Cabinet Ministers are also entitled to a motor-car allowance of \$2,000. The Speakers of the Senate and of the House of Commons receive, besides their sessional indemnity, a salary of \$3,000 and a motor-car allowance of \$1,000 and are also entitled to \$3,000 in lieu of residence. Parliamentary Assistants to the Ministers of the Crown, of whom there are 10 as at Nov. 15, 1948, receive \$4,000 sessional indemnity as Members of Parliament, \$4,000 a year as Parliamentary Assistants and the \$2,000 allowed to all other Members of Parliament.

9.—Electoral Districts, Voters on List and Votes Polled, Names and Addresses of Members of the House of Commons, as Elected at the Twentieth General Election, June 11, 1945.

Speaker.....The Hon. GASPARD FAUTEUX
Clerk of the House.....A. BEAUCHESNE, K.C., C.M.G., M.A.
Leader of the Opposition.....JOHN BRACKEN

NOTE.—This information, except the populations of constituencies, has been supplied by the Chief Electoral Officer, Ottawa. Party affiliations are unofficial. The vote is summarized by provinces for this general election in Table 11, p. 94. By-elections taking place between the date of this election and Nov. 15, 1948, are indicated by footnotes and are summarized in Table 10, pp. 92-93. The leaders of the political parties are indicated by asterisks (*) and Parliamentary Assistants by footnotes.

The Opposition.—The Opposition occupies an essential place in constitutions based on the British Parliamentary System. Like many other institutions such as that of Prime Minister, for instance, it takes its place with the many unwritten arrangements, tested by time, that have been accepted and become firmly established.

The choice of the Canadian electorate not only determines who shall govern Canada but, by deciding which party receives the second largest number of seats in the House of Commons, it settles which of the major parties becomes the Official Opposition. The function of the Leader of the Opposition is to offer intelligent and constructive criticism of the government of the day.

When criticism by the Opposition becomes sufficiently effective it can overthrow the existing government and the Leader of the Opposition might then, as a result of the ensuing election, find himself in the Prime Minister's seat.

Although the position of Leader of the Opposition is not recognized in the British North America Act, it received statutory acknowledgement in Canada in 1927. The Senate and House of Commons Act of that year provided for an annual salary to be paid to the Leader of the Opposition in addition to his indemnity as a Member of the House. (See p. 87.)

The Franchise.*—Legislation concerning the right to vote at Federal elections is outlined at pp. 72-73 of the 1947 Year Book.

* Revised by Jules Castonguay, Chief Electoral Officer, Ottawa.

The present franchise laws are contained in the Dominion Elections Act, 1938 (2 Geo. VI, c. 46, as amended by 6 Geo. VI, c. 26 and 12 Geo. VI, c. 46). The franchise is conferred upon all British subjects, men and women, who have attained the age of 21 years and who have been ordinarily resident in Canada for 12 months prior to polling day at a Dominion election, and ordinarily resident in the electoral district on the date of the issue of the writ for such election. Classes of persons denied the right to vote are:—

- (1) Judges appointed by the Governor General in Council;
- (2) The returning officer for each electoral district;
- (3) Persons undergoing punishment as inmates of any penal institution for the commission of any offence;
- (4) Indians ordinarily resident on an Indian reservation who did not serve in the First or Second World Wars;
- (5) Persons restrained of their liberty or management of their property by reason of mental disease;
- (6) Eskimos, whether born in Canada or elsewhere;
- (7) Doukhobors, residing in the Province of British Columbia, whether born in Canada or elsewhere;
- (8) Persons disqualified under any law relating to the disqualification of electors for corrupt and illegal practices.

The Act to amend the Dominion Elections Act, passed on June 15, 1948, removed the provisions previously in effect which disqualified Japanese or other persons by reason of race from voting at Dominion elections, also inmates of institutions maintained by any government or municipality for the housing of the poor.

Special procedure prescribed by the Canadian War Service Voting Regulations, 1944, and the Canadian Prisoners of War Voting Regulations, 1944, is outlined at p. 74 of the 1947 Year Book.

11.—Voters on the Lists and Votes Polled at the General Elections of 1930, 1935, 1940 and 1945

NOTE.—Corresponding statistics for the general elections of 1911, 1917, 1921 and 1925 will be found at p. 82 of the 1926 Year Book and those for the general election of 1926 at p. 66 of the 1945 edition.

¹ Each voter in the double-member constituency of Queens County, P.E.I., had two votes; in 1945, 24,540 voters on the list cast 38,812 votes. ² Each voter in the double-member constituency of Halifax, N.S., had two votes; in 1945, 85,232 voters on the list cast 105,618 votes.

³ Each voter in the double-member constituency of St. John-Albert, N.B., had two votes; in 1930, 37,067 voters on the list cast 50,121 votes. ⁴ Not including one electoral district in which the return was by acclamation.

⁵ Each voter in the double-member constituency of Ottawa, Ont., had two votes; in 1930, 61,535 voters on the list cast 97,369 votes. ⁶ Not including two electoral districts in which the returns were by acclamation.

Subsection 3.—The Judiciary**The Federal Judiciary**

The Parliament of Canada is empowered by Sect. 101 of the British North America Act to provide from time to time for the constitution, maintenance and organization of a general Court of Appeal for Canada and for the establishment of any additional courts for the better administration of the laws of Canada. Under this provision the Parliament of Canada has established the Supreme Court of Canada, the Exchequer Court of Canada and certain miscellaneous courts.

Supreme Court of Canada.—This Court (first established in 1875 by 38 Vict., c. 11, and now governed by the Supreme Court Act, R.S.C. 1927, c. 35) consists of a chief justice, who is called the Chief Justice of Canada, and six puisne judges. The chief justice and the puisne judges are appointed by the Governor in Council and they hold office during good behaviour but are removable by the Governor General on address of the Senate and House of Commons and they cease to hold office upon attaining the age of 75 years. The Court sits at Ottawa and exercises general appellate jurisdiction throughout Canada in civil and criminal cases. The Court is also required to consider and advise upon questions referred to it by the Governor in Council and it may also advise the Senate or House of Commons on private bills referred to the Court under any rules or orders of the Senate or House of Commons.

Appeals may be brought from any final judgment of the highest court of final resort in a province in any case where the amount or value of the matter in controversy exceeds the sum of \$2,000. Where the amount in controversy does not exceed \$2,000 an appeal may be brought with leave of the highest court of final resort in the province; if such court refuses to grant leave the Supreme Court of Canada may, in special cases, grant leave to appeal. Appeals in criminal cases are regulated by Sects. 1023 and 1025 of the Criminal Code. Appeals from Dominion courts are regulated by the statutes establishing such courts.

The judgment of the Supreme Court of Canada in criminal cases is final and conclusive but in civil cases a further appeal may be taken to the Judicial Committee of the Privy Council with leave of the Privy Council.

Exchequer Court.—The Exchequer Court of Canada was first established in 1875 as part of the Supreme Court of Canada but it is now a separate court and is governed by the Exchequer Court Act (R.S.C. 1927, c. 34). The Court consists of a president and three puisne judges who are appointed by the Governor in Council. The president and the puisne judges hold office during good behaviour but may be removed by the Governor General on address of the Senate and House of Commons and they cease to hold office upon attaining the age of 75 years. The Court sits at Ottawa and also at any other place in Canada for which sittings may be fixed by the Court. The jurisdiction of the Court extends to cases where claims are made by or against the Crown in right of Canada. Proceedings against the Crown are taken by petition of right pursuant to the Petition of Right Act (R.S.C. 1927, c. 158). Before proceedings can be taken against the Crown a fiat from the Governor General must be obtained.

An appeal lies to the Supreme Court of Canada from any final judgment of the Exchequer Court in which the amount in controversy exceeds \$500; an appeal also lies with leave of the Supreme Court in certain cases where the amount in controversy does not exceed \$500.

The Exchequer Court also exercises admiralty jurisdiction in Canada. Admiralty jurisdiction was first conferred in 1891 by the Admiralty Act (54-55 Vict., c. 29) and the admiralty jurisdiction is now governed by the Admiralty Act (24-25 Geo. V, c. 31). Under this statute the Exchequer Court is continued as a Court of Admiralty. The president and puisne judges of the Exchequer Court exercise admiralty jurisdiction throughout the whole of Canada. In addition, Canada is divided into various admiralty districts; a district judge in admiralty is appointed for each district and he exercises admiralty jurisdiction within his district. Appeals to the Supreme Court of Canada from judgments of the president or the puisne judges are governed by the general appeal provisions in the Exchequer Court Act. Appeals may be taken from a final judgment of a district judge in admiralty either to the Exchequer Court or directly to the Supreme Court of Canada.

Miscellaneous Courts. — *Railway Act.* — The Railway Act (R.S.C. 1927, c. 170) established the Board of Railway Commissioners for Canada as a court of record; by the Transport Act, 1938 (2 Geo. VI, c. 53), the name was changed to the Board of Transport Commissioners for Canada. This Court exercises jurisdiction with respect to railway matters. The Governor in Council is given jurisdiction to vary any order of the Board and an appeal lies from the Board to the Supreme Court of Canada upon a question of jurisdiction or a question of law.

Bankruptcy Act. — By virtue of para. 21 of Sect. 91 of the British North America Act, Parliament has exclusive legislative jurisdiction in relation to bankruptcy and insolvency. By the Bankruptcy Act (R.S.C. 1927, c. 11) the superior courts of the provinces are constituted bankruptcy courts; original jurisdiction is conferred upon the trial courts and appellate jurisdiction is conferred upon the appeal courts of the provinces.

Farmers' Creditors Arrangement Act. — Under the Farmers' Creditors Arrangement Act, 1943 (7 and 8 Geo. VI, c. 26), the county or district courts of the provinces are established as courts for the purposes of this Act and the appeal courts of the provinces are given appellate jurisdiction.

Provincial Judiciaries

Express provisions of the British North America Act govern, to some extent, the provincial judiciaries. Under Sect. 92 (14) the legislature of each province may exclusively make laws in relation to the administration of justice in the province including the constitution, maintenance and organization of provincial courts, both of civil and criminal jurisdiction. Sect. 96 provides that the Governor General shall appoint the judges of the Superior, District and County Courts in each province, except those of the Courts of Probate in Nova Scotia and New Brunswick. Sect. 100 provides that the salaries, allowances and pensions of judges of the Superior, District and County Courts (except the Courts of Probate in Nova Scotia and New Brunswick) are to be fixed and provided by the Parliament of Canada, and these are set out in the Judges Act, 1946 (10 Geo. VI, c. 56). Under Sect. 99 the judges of the Superior Courts hold office during good behaviour, but are removable by the Governor General on address of the Senate and House of Commons. The

tenure of office of District and County Court judges is fixed by Sect. 33 of the Judges Act, 1946, as being during good behaviour and their residence within the county or union of counties for which the Court is established.

Prince Edward Island.—*Supreme Court (S.P.E.I. 1940, c. 35).*—The Supreme Court of Prince Edward Island consists of a chief justice, who is known as the Chief Justice of Prince Edward Island, and two other judges, all appointed by the Governor General. The Court has original and appellate jurisdiction.

Court of Chancery (S.P.E.I. 1940, c. 11).—The Court of Chancery consists of a Chancellor, a Vice-Chancellor and the Master of the Rolls. The Chancellor is the Lieutenant-Governor, the Vice-Chancellor is one of the judges of the Supreme Court and the Master of the Rolls is one of the other judges of the Supreme Court. The Court has original jurisdiction in chancery matters.

County Courts (S.P.E.I. 1937, c. 6).—There are three counties in the Province with a County Court and judge for each county. Each Court has criminal jurisdiction and also civil jurisdiction generally in actions up to \$500, but has no jurisdiction in cases involving title to or possession of land.

Probate Court (S.P.E.I. 1938, c. 41).—There is one judge, appointed by the Lieutenant-Governor in Council. The Court has jurisdiction in probate and guardianship matters.

Magistrates and Justices of the Peace (S.P.E.I. 1939, c. 32).—Magistrates and justices of the peace are appointed by the Lieutenant-Governor in Council. They have limited criminal and civil jurisdiction.

Nova Scotia.—*Supreme Court (S.N.S. 1919, c. 32).*—The Supreme Court of Nova Scotia consists of a chief justice and six other judges appointed by the Governor General in Council. The Court has original and appellate jurisdiction in civil and in criminal cases. Sitting individually the judges act as Trial Division and sitting *en banc* the judges act as Appeal Judges.

Court of Divorce and Matrimonial Causes (R.S.N.S., 3rd Series, c. 126).—This Court was established by a pre-Confederation statute and has divorce jurisdiction only. The judge is one of the judges of the Supreme Court.

County Courts (S.N.S. 1945, c. 5).—There are seven County Court districts in Nova Scotia and a County Court and judge for each district. The judges are appointed by the Governor General. Each Court has criminal jurisdiction and jurisdiction in civil cases up to \$1,000, but no jurisdiction where any devise or bequest is disputed.

Probate Court (R.S.N.S. 1923, c. 217).—By the Probate Act the County Court judges are ex officio judges in probate. Probate matters are decided in the first instance by a registrar of probate and appeals may be taken to the probate judges. A registrar of probate is appointed for each county.

Magistrates.—There are 64 stipendiary magistrates and six provincial magistrates, all appointed by the Lieutenant-Governor in Council. They have limited criminal jurisdiction and civil jurisdiction up to \$100.

Minor Courts of Civil Jurisdiction.—These consist of Courts established pursuant to city charters, Municipal Courts and Justices Courts. The City and Municipal Courts have jurisdiction up to \$100 and Justices Courts have jurisdiction up to \$20 singly or up to \$80 when two justices are sitting.

Juvenile Courts (R.S.N.S. 1923, c. 166).—The Children's Protection Act provides for the establishment of Juvenile Courts and the appointment of Juvenile Court judges. The Courts exercise jurisdiction in juvenile matters under provincial statutes and are also Juvenile Courts under the Dominion Juvenile Delinquents Act. There are six Juvenile Court judges.

New Brunswick.—*Supreme Court (R.S.N.B. 1927, c. 113).*—The Supreme Court of New Brunswick consists of three divisions, namely, an Appeal Division, a Chancery Division and a King's Bench Division. The Appeal Division consists of a chief justice, who is known as the Chief Justice of New Brunswick, and two other judges. The Chancery Division consists of three judges who are the judges of the Appeal Division. The King's Bench Division consists of a chief justice and three other judges. The Appeal Division has general appellate jurisdiction throughout the Province and the King's Bench Division has unlimited original jurisdiction throughout the Province in civil and criminal matters except in chancery. All judges are appointed by the Governor General.

Court of Divorce and Matrimonial Causes (R.S.N.B. 1927, c. 115).—This Court was established by a pre-Confederation statute which has continued in force to date. It has divorce jurisdiction only. There is one judge who is appointed by the Governor General.

County Courts (R.S.N.B. 1927, c. 116).—The Province is divided into counties with a County Court for a county or group of counties. There are six County Court judges, appointed by the Governor General. The Court has criminal jurisdiction, jurisdiction in contracts up to \$400 and jurisdiction in damage actions up to \$200. The Court has no jurisdiction where title to land is brought in question or the validity of any devise or bequest is disputed.

Probate Court (R.S.N.B. 1927, c. 120).—A Probate Court is established by provincial Act for each county and each Court is presided over by a judge appointed by the Lieutenant-Governor in Council. The Court has jurisdiction over estates.

Juvenile Court (S.N.B. 1944, c. 44).—The Juvenile Courts Act provides for the establishment of a Juvenile Court for each place where the Dominion Juvenile Delinquents Act is in force. Two judges have been appointed, one for Saint John and one for Moncton. The Court has jurisdiction in juvenile matters under provincial statutes and is also a Juvenile Court under the Dominion Juvenile Delinquents Act.

Magistrates.—There are four classes of magistrates, namely, those appointed under the Local Courts Act (R.S.N.B. 1927, c. 121), the Towns Incorporation Act (R.S.N.B. 1927, c. 179), under city charters and under the Magistrates Act (S.N.B. 1942, c. 58). Magistrates have limited civil and criminal jurisdiction.

Justices and Commissioners Courts.—These are Courts of limited jurisdiction which are gradually being replaced by Magistrates Courts.

Quebec (R.S.Q. 1941, c. 15).—*Court of King's Bench.*—The Court consists of a chief justice, who is called the Chief Justice of the Province of Quebec, and 11 other judges, all of whom are appointed by the Governor General in Council. The Court has appellate jurisdiction in civil and criminal matters and has original jurisdiction in criminal cases.

Superior Court.—The Superior Court consists of a chief justice, an associate chief justice and 35 other judges, all of whom are appointed by the Governor General. The Court has general original jurisdiction in civil cases throughout the Province.

Magistrates.—Magistrates are appointed by the Lieutenant-Governor in Council. They exercise criminal jurisdiction and also civil jurisdiction in cases up to \$200.

Family Courts.—The Lieutenant-Governor in Council is authorized to establish Family Courts but a Court may be established only for a territory that includes a city with a population of over 25,000. The judges are appointed by the Lieutenant-Governor in Council. Every Family Court is a Juvenile Court under the Dominion Juvenile Delinquents Act.

Sessions of the Peace.—The Courts are established and the judges appointed by provincial authority. Two judges are to reside at Montreal and at least one judge at the city of Quebec. The Courts have criminal jurisdiction only.

Justices of the Peace, Recorder's Courts and Commissioners' Courts.—These Courts are established by provincial authority. They have limited civil and criminal jurisdiction. The Recorder's Courts and Commissioners' Courts deal largely with municipal matters.

Ontario.—*Supreme Court (R.S.O. 1937, c. 100).*—The Supreme Court of Ontario consists of two divisions, one of which is known as the Court of Appeal for Ontario and the other as the High Court of Justice for Ontario. The Court of Appeal consists of a chief justice, who is called the Chief Justice of Ontario, and seven other judges. The High Court of Justice consists of a chief justice, who is known as the Chief Justice of the High Court, and 14 other judges. All judges are appointed by the Governor General. The Court of Appeal has general appellate jurisdiction throughout the Province and the High Court of Justice has unlimited original jurisdiction in civil and criminal matters.

County and District Courts (R.S.O. 1937, c. 103).—The Province is divided into counties and districts, of which there are 48 in all. There is a County or District Court for each county or district and one or more judges for each Court. There are 62 judges in all, and they are appointed by the Governor General. The Court has criminal jurisdiction, jurisdiction in contracts where the amount claimed does not exceed \$800 and jurisdiction in personal and property actions where the amount claimed does not exceed \$500.

Surrogate Courts (R.S.O. 1937, c. 106).—There is a Surrogate Court for each county or district. The Court has jurisdiction to deal with probate and administration matters and is presided over by the County or District Court judge for the district.

Division Courts (R.S.O. 1937, c. 107).—There are 285 Division Courts throughout the Province. These are presided over by the County or District Court judge who sits in the jurisdiction where the particular Division Court is located. Jurisdiction is limited to cases up to \$200 except where there is a written contract or a promise in which case jurisdiction extends to \$400.

Juvenile Courts (R.S.O. 1937, c. 316).—There is a Juvenile Court for Ontario and it has jurisdiction in juvenile cases under provincial legislation; in addition it is a Juvenile Court for the purposes of the Dominion Juvenile Delinquents Act. The judges are appointed by the Lieutenant-Governor in Council; sometimes the county or district judge is appointed, sometimes the local magistrate and sometimes a person is appointed specially for the purpose of acting as a Juvenile Court judge.

Magistrates (R.S.O. 1937, c. 133).—Magistrates are appointed by the Lieutenant-Governor in Council. They have limited civil and criminal jurisdiction and are ex officio justices of the peace.

Justices of the Peace (R.S.O. 1937, c. 132).—Justices of the peace are appointed by the Lieutenant-Governor in Council. They have limited civil and criminal jurisdiction.

Manitoba.—*Court of Appeal (R.S.M. 1940, c. 40).*—The Court of Appeal consists of a chief justice, who is called the Chief Justice of Manitoba, and four other judges. All judges are appointed by the Governor General. The Court has general appellate jurisdiction throughout the Province.

Court of King's Bench (R.S.M. 1940, c. 44).—The Court consists of a chief justice, who is known as the Chief Justice of the King's Bench, and four other judges. All judges are appointed by the Governor General. The Court has unlimited original jurisdiction throughout the Province in civil and criminal cases.

County Courts (R.S.M. 1940, c. 42).—The Province is divided into six judicial districts and a number of County Courts are established for each district. A judge is appointed by the Governor General for each district and he is the judge of all the County Courts within the district. There are five judges for the Eastern Judicial District and the other districts each have one judge. The Court has criminal jurisdiction and also jurisdiction generally in claims not exceeding \$800 but has no jurisdiction in certain types of actions such as recovery of land.

Surrogate Court (R.S.M. 1940, c. 45).—There is a Surrogate Court for each judicial district and the Surrogate Courts Act provides that the County Court judge in each judicial district is to be the judge of the Surrogate Court of that district. The Court has jurisdiction and authority in relation to testamentary matters.

Juvenile Court (R.S.M. 1940, c. 32).—The Juvenile Courts are established under the Child Welfare Act and the territorial jurisdiction of each Court is set out in the Order in Council establishing the Court and appointing the judges. There are two judges for Winnipeg, one for Brandon, and one for Dauphin. In addition, there are 22 deputy judges. The Courts have power to deal with cases involving children under the Child Welfare Act and other provincial statutes and are also Juvenile Courts for the purposes of the Dominion Juvenile Delinquents Act.

Police Magistrates (R.S.M. 1940, c. 125).—Police magistrates are appointed by the Lieutenant-Governor and in addition to criminal jurisdiction they have jurisdiction to try actions for debt where the amount does not exceed \$100. An appeal lies to the judge of a County Court. There are 40 police magistrates in the Province.

Justices of the Peace (R.S.M. 1940, c. 125).—Justices of the peace are appointed by the Lieutenant-Governor in Council. They have limited criminal jurisdiction and also small debt jurisdiction up to \$100.

Saskatchewan.—*Court of Appeal (R.S.S. 1940, c. 60).*—The Court of Appeal consists of a chief justice, who is called the Chief Justice of Saskatchewan, and four other judges. All judges are appointed by the Governor General. The Court has general appellate jurisdiction throughout the Province.

Court of King's Bench (R.S.S. 1940, c. 61).—The Court of King's Bench consists of a chief justice, who is called the Chief Justice of the King's Bench, and six other judges. All judges are appointed by the Governor General. The Court has unlimited original jurisdiction throughout the Province in civil and criminal matters.

District Courts (R.S.S. 1940, c. 62).—The Province is divided into 21 judicial districts and there is a District Court for each judicial district. The judges are appointed by the Governor General. Each Court has jurisdiction generally in all cases where the claim does not exceed \$1,200, but jurisdiction does not include cases where title to land is brought in question or where the validity of any devise or bequest is disputed. Jurisdiction is also excluded in certain personal actions such as malicious prosecution, malicious arrest, false imprisonment, libel, slander and breach of promise of marriage. The Court also has criminal jurisdiction.

Surrogate Courts (R.S.S. 1940, c. 63).—There is a Surrogate Court for each judicial district and the Surrogate Courts Act provides that the judge of the District Court shall be the judge of the Surrogate Court. The Court has jurisdiction in probate matters.

Juvenile Court (S.S. 1946, c. 91).—Under the Child Welfare Act a Juvenile Court is established. Each judge of a District Court and each police magistrate in the Province is ex officio a judge of the Juvenile Court and, in addition, the Lieutenant-Governor in Council may appoint other judges of the Juvenile Court. The Court has jurisdiction over juvenile offences under provincial statutes and also has jurisdiction, under the Dominion Juvenile Delinquents Act.

Magistrates' Courts (R.S.S. 1940, c. 94).—Magistrates are appointed by the Lieutenant-Governor in Council. There are eight full-time and eight part-time magistrates. All the magistrates exercise criminal jurisdiction. They are ex officio justices of the peace and accordingly have the jurisdiction of a justice of the peace in civil cases.

Justices of the Peace (R.S.S. 1940, c. 95).—Justices of the peace are appointed by the Lieutenant-Governor in Council and, in addition to limited criminal jurisdiction, have jurisdiction in civil cases up to \$100.

Alberta.—*Supreme Court (R.S.A. 1942, c. 129).*—The Supreme Court of Alberta consists of two branches or divisions; one is designated the Appellate Division of the Supreme Court of Alberta and the other is designated the Trial Division of the Supreme Court of Alberta. The Appellate Division consists of a chief justice, who is called the Chief Justice of Alberta, and four other judges. The Trial Division consists of a chief justice, who is called the Chief Justice of the Trial Division, and five other judges. All judges of the Supreme Court are appointed by the Governor General. The Appellate Division exercises general appellate jurisdiction throughout the Province and the Trial Division has unlimited original jurisdiction in civil and criminal matters.

District Courts (R.S.A. 1942, c. 121).—There are two District Court districts in Alberta, namely, the District of Northern Alberta and the District of Southern Alberta, with a District Court for each District. The Court of the District of Northern Alberta consists of a chief judge and five other judges and the Court of the District of Southern Alberta consists of a chief judge and four other judges. All judges are appointed by the Governor General. The District Courts generally have jurisdiction in all cases where the claim does not exceed \$600 and in addition have jurisdiction in criminal, probate and guardianship matters.

Juvenile Courts (S.A. 1944, c. 8).—The Child Welfare Act establishes a Juvenile Court for the Province and every judge of the Supreme Court, every judge of a District Court and every police magistrate is ex officio a judge of the Juvenile Court. In addition the Lieutenant-Governor in Council may appoint other persons to be judges of the Juvenile Court; 11 such judges have been appointed. The Court has jurisdiction to hear and determine offences charged against children under any statute of the Province and, in addition, the Court is a Juvenile Court for the purposes of the Dominion Juvenile Delinquents Act.

Police Magistrates (R.S.A. 1942, c. 134).—Police magistrates have criminal jurisdiction and also jurisdiction in actions for debt not exceeding \$100 and wage claims not exceeding six months' wages. Ninety-six police magistrates have been appointed.

Justices of the Peace (R.S.A. 1942, c. 134).—Justices of the peace are appointed by the Lieutenant-Governor in Council. They have limited civil and criminal jurisdiction.

British Columbia.—*Court of Appeal (R.S.B.C. 1936, c. 57).*—The Court of Appeal consists of a chief justice, who is called the Chief Justice of British Columbia, and four other judges who are called Justices of Appeal. All are appointed by the Governor General. The Court exercises general appellate jurisdiction.

Supreme Court (R.S.B.C. 1936, c. 56).—This Court consists of a chief justice, who is called the Chief Justice of the Supreme Court, and five other judges who are called Judges of the Supreme Court. All are appointed by the Governor General. The Court has unlimited original jurisdiction throughout the Province in civil and criminal matters.

County Courts (R.S.B.C. 1936, c. 58).—There are eight counties in the Province with a County Court for each county and one or more judges for each County Court. All judges are appointed by the Governor General. Each County Court has jurisdiction up to \$1,000 generally and in some cases up to \$2,500. The Courts have no jurisdiction in certain types of personal actions such as libel, slander or breach of promise of marriage. The County Courts also have jurisdiction in criminal and probate matters.

Small Debts Court (R.S.B.C. 1936, c. 62).—The Small Debts Court Act provides that the Lieutenant-Governor in Council may appoint any stipendiary magistrate, police magistrate or any two justices of the peace to exercise small debt jurisdiction within the territorial limits for which he or they have been appointed. There are 97 Small Debts Court magistrates. Jurisdiction is limited to \$100 and an appeal lies to the nearest County Court judge or Supreme Court judge.

Magistrates and Justices of the Peace (R.S.B.C. 1936, c. 163).—Magistrates and justices of the peace are appointed by the Lieutenant-Governor in Council. They have limited civil and criminal jurisdiction.

Section 2.—Provincial Governments

In each of the provinces, the King is represented by a Lieutenant-Governor appointed by the Governor General in Council and acts on the advice and with the assistance of his Ministry or Executive Council, which is responsible to the Legislature and resigns office when it ceases to enjoy the confidence of that body. The

Legislature of each province, with the exception of Quebec, is now unicameral, consisting of a Legislative Assembly elected by the people. In Quebec there is a Legislative Council as well as a Legislative Assembly.

12.—Provinces and Territories of Canada, with Present Areas, Dates of Admission to Confederation, and Legislative Process by which Admission was Effected

Province, Territory or District	Date of Admission or Creation	Legislative Process	Present Area (square miles)

			541,753	7,500	549,253 ⁶
Totals.....			3,462,103	228,307	3,690,410

¹ The area of Ontario was extended by the Ontario Boundaries Extension Act, 1912 (2 Geo. V, c. 40).

² Extended by Quebec Boundaries Extension Act, 1912 (2 Geo. V, c. 45), and diminished in consequence of the Award of the Judicial Committee of the British Privy Council (Mar. 1, 1927), whereby some 112,400 square miles of territory, formerly considered as part of Quebec, were assigned to Newfoundland.

³ Extended by Extension of Boundaries of Manitoba Act, 1881, and Manitoba Boundaries Extension Act, 1912 (2 Geo. V, c. 32).

⁴ Too small to be enumerated. ⁵ Alberta and Saskatchewan now cover approximately the area formerly comprised in the districts of Assiniboia, Athabaska, Alberta and Saskatchewan, established May 17, 1882, by minute of Canadian P.C., concurred in by Dominion Parliament and Order in Council of Oct. 2, 1895.

⁶ By Order in Council, June 23, 1870, Rupert's Land, acquired under the Rupert's Land Acts of 1867 and 1868, and the undefined Northern Territories were admitted into the Confederation. The original Northwest Territories, mentioned in the Manitoba Act, 1870, were established by the Northwest Territories Act, 1880 (43 Vict., c. 25), the District of Keewatin having been previously defined by an Act of the Dominion Parliament (39 Vict., c. 21). The provisional Districts of Yukon, Mackenzie, Franklin and Ungava were defined in an Order in Council of Oct. 2, 1895, their boundaries being changed by Order in Council of Dec. 18, 1897. By Order in Council of July 24, 1905, the area of Keewatin, not included in the Northwest Territories, was annexed to the latter from Sept. 1, 1905. By the Extension of Boundaries Act, 1912, Ungava was made a part of the Province of Quebec, and the remaining area of the Northwest Territories south of 60° N. latitude was divided between Manitoba and Ontario.

The source of the powers of the Provincial Governments of Canada is the British North America Act, 1867 (30-31 Vict., c. 3 and amendments). Under Sect. 92 of the Act, the Legislature of each province may exclusively make laws in relation to the following matters: amendment of the constitution of the province, except as regards the Lieutenant-Governor; direct taxation within the province; borrowing of money on the credit of the province; establishment and tenure of provincial offices and appointment and payment of provincial officers; the management and sale of public lands belonging to the province and of the timber and wood thereon; the establishment, maintenance and management of public and reformatory prisons in and for the province; the establishment, maintenance and management of hospitals, asylums, charities and eleemosynary institutions in and for the province, other than marine hospitals; municipal institutions in the province; shop, saloon, tavern, auctioneer and other licences issued for the raising of provincial or municipal revenue; local works and undertakings other than interprovincial or international lines of ships, railways, canals, telegraphs, etc., or works which,

though wholly situated within one province, are declared by the Federal Parliament to be for the general advantage either of Canada or of two or more provinces; the incorporation of companies with provincial objects; the solemnization of marriage in the province; property and civil rights in the province; the administration of justice in the province, including the constitution, maintenance and organization of provincial courts both of civil and criminal jurisdiction, and including procedure in civil matters in these courts*; the imposition of punishment by fine, penalty, or imprisonment for enforcing any law of the province relating to any of the aforesaid subjects; generally all matters of a merely local or private nature in the province.

Further, in and for each province the Legislature may, under Sect. 93, exclusively make laws in relation to education, subject to certain provisions. The purpose of these provisions is to preserve to a religious minority in any province the same privileges and rights in regard to education which it had at the date of Confederation, but the provincial Legislatures were not debarred from legislating on the subject of separate schools provided they did not thereby prejudicially affect privileges enjoyed before Confederation by such schools in the province.

These powers, given to the four original provinces in Confederation, have, with some slight changes, been retained ever since and the more recently admitted provinces have assumed the same rights and responsibilities on their inclusion as units in the federation as were previously enjoyed by the older members.

The tables in the following Subsections are brought up to June 30, 1948, except where provincial elections were held subsequently.

Subsection 1.—Prince Edward Island

The Government of Prince Edward Island consists of a Lieutenant-Governor, an Executive Council and a Legislative Assembly. The Executive Council of Prince Edward Island consists of: the President of the Council, Premier, Minister of Education and Provincial Secretary-Treasurer; the Attorney and Advocate General; the Minister of Health and Welfare; the Minister of Agriculture; the Minister of Public Works and Highways; and four Ministers without portfolio. The Assembly has 30 members who serve for five years, 15 of whom are elected on a basis of manhood suffrage and the other 15 elected by property holders only.

* A description of the provincial courts is given at pp. 96-102.

13.—Lieutenant-Governors of Prince Edward Island, 1873-1948, Legislatures and Premiers, 1934-48, and Present Ministry as at June 30, 1948

NOTE.—The Lieutenant-Governor of a province is addressed "His Honour" and is also styled "Honourable" throughout his life. Where a knighthood or other honour was conferred during the term of office, it is shown. Certain Lieutenant-Governors were knighted after their term had expired. Legislatures and Ministries from Confederation to 1923 are given at pp. 75-84 of the 1924 Year Book, and for 1924-34 at pp. 110-118 of the 1938 Year Book.

Minister without portfolio.....	HON. HARRY COX.....	Apr. 12, 1948

Subsection 2.—Nova Scotia

The Province of Nova Scotia has a House of Assembly consisting of 30 members which was increased by legislation in 1948 to 37 members effective at the next General Election. The members of the Assembly are elected for five years, the maximum duration of its existence. The Ministry or Cabinet, styled the Executive Council, consists of the Premier and Provincial Treasurer; the Attorney General who is also Minister of Labour; the Minister of Public Health who is also Minister of Public Welfare, Minister of Municipal Affairs and Registrar General; the Minister of Mines who is also Provincial Secretary; the Minister of Highways and Public Works; the Minister of Agriculture and Marketing who is also Minister of Lands and Forests; the Minister of Trade and Industry, and two Ministers without portfolio one of whom is in charge of the administration of the Nova Scotia Liquor Control Act.

14.—Lieutenant-Governors of Nova Scotia, 1867-1948, Legislatures and Premiers, 1934-48, and Present Ministry as at June 30, 1948

NOTE.—See headnote to Table 13, p. 104.

Minister without portfolio.....	Hon. GEOFFREY STEVENS.....	Apr. 4, 1946

Subsection 3.—New Brunswick

The Province of New Brunswick in all essential features of provincial administration is similar to its neighbour, Nova Scotia. The Legislative Assembly at present has 52 members who are elected for a term of five years. The Executive Council is composed of: the Premier and Attorney General, the Provincial Secretary-Treasurer and President of the Executive Council, the Minister of Public Works,

the Minister of Lands and Mines, the Minister of Agriculture, the Minister of Health and Social Services, the Minister of Labour, the Minister of Education and of Federal and Municipal Relations, the Minister of Industry and Reconstruction and a Minister without portfolio who is the Chairman of the New Brunswick Electric Power Commission.

15.—Lieutenant-Governors of New Brunswick, 1867-1948, Legislatures and Premiers, 1934-48, and Present Ministry as at June 30, 1948

NOTE.—See headnote to Table 13, p. 104.

Minister without portfolio.....	Hon. J. GASPARD BOUCHER.....	Mar. 13, 1940

Subsection 4.—Quebec

The Legislative Assembly of Quebec has 92 members and the Legislative Council has 24 members nominated for life by the Lieutenant-Governor in Council. The Executive council is composed of the Lieutenant-Governor and his advisers, the Ministers of the Crown. These are: the Premier, Attorney General and President of the Executive Council; the Provincial Treasurer; the Minister of Lands and Forests; the Minister of Health; the Minister of Municipal Affairs; the Minister of Colonization; the Minister of Mines; the Minister of Agriculture; the Minister of Roads; the Minister of Labour; the Minister of Game and Fisheries; the Minister of Public Works; the Minister of Social Welfare and Youth; the Minister of Trade and Commerce; the Provincial Secretary; and six Ministers without portfolio.

The Legislative Assembly and also the Legislative Council have the power to bring forward bills relating to civil and administrative matters and to amend or repeal the laws that already exist. A bill, to be approved by the Lieutenant-Governor, must have received the assent of both Houses. Only the Legislative Assembly can bring forward a bill requiring the expenditure of public money. The extreme length of a Legislature is five years.

16.—Lieutenant-Governors of Quebec, 1867-1948, Legislatures and Premiers, 1934-48, and Present Ministry as at July 28, 1948

Subsection 5.—Ontario

The House of Assembly of Ontario, the single-chamber Legislature of the Province, is composed of 90 elected members. It is elected for five years on an adult suffrage basis and holds annual sessions so that 12 months shall not intervene between the last sitting in one session and the first sitting in the next.

The Executive Council consists (1948) of 13 members holding portfolios as follows: Premier, President of the Council and Minister of Education; Attorney General; Minister of Lands and Forests; Minister of Agriculture; Minister of Highways and Minister of Public Works; Minister of Labour; Provincial Treasurer and Minister of Mines; Provincial Secretary and Registrar; Minister of Municipal Affairs and Minister of Reform Institutions; Minister of Health; Minister of Public Welfare; Minister of Planning and Development; Minister of Travel and Publicity; and three Ministers without portfolio.

Besides the regular departments, certain commissions have been created for specific purposes. They include the Niagara Parks Commission, the Ontario Municipal Board, the Hydro-Electric Power Commission of Ontario and the Ontario Northland Transportation Commission.

17.—Lieutenant-Governors of Ontario, 1867-1948, Legislatures and Premiers, 1934-48, and Present Ministry as at June 30, 1948

NOTE.—See headnote to Table 13, p. 104.

Minister of Agriculture.....	Hon. D. A. URE.....	May 8, 1948
Minister of Industries and Labour.....	Hon. J. L. ROBINSON.....	May 8, 1948

Subsection 9.—British Columbia

The Lieutenant-Governor of British Columbia acts on the advice of an Executive Council composed of: the Premier and President of the Council; Provincial Secretary

and Minister of Health and Welfare; Attorney General and Minister of Labour; Minister of Lands and Forests; Minister of Finance; Minister of Agriculture; Minister of Mines and Minister of Municipal Affairs; Minister of Public Works; Minister of Railways, Minister of Trade and Industry, and Minister of Fisheries; Minister of Education. The Legislative Assembly, elected for a five-year period, has 48 members.

21.—Lieutenant-Governors of British Columbia, 1871-1948, Legislatures and Premiers, 1934-48, and Present Ministry as at June 30, 1948

NOTE.—See headnote to Table 13, p. 104.

Subsection 10.—Yukon and the Northwest Territories

Yukon.—The Yukon Act provides for a local government composed of a Chief Executive styled Commissioner but classified as Controller, who is appointed by the Governor-General in Council; also an elective Legislative Council of three members having a three-year tenure of office. The Yukon Territorial Council performs much the same functions as do the Provincial Governments. The Controller functions in lieu of the Provincial Cabinet and the three members of the Territorial Council function in lieu of the Provincial Parliament. The seat of local government is at Dawson, but the Controller acts under instructions from the Governor-General in Council or the Minister of Mines and Resources at Ottawa.

The present Controller is John Edward Gibben, appointed Sept. 13, 1947, and the Members of the Territorial Council are: Dawson District, JOHN R. FRASER; Whitehorse District, R. GORDON LEE; and Mayo District, ERNEST J. CORP. The Commissioners who held office previous to the present are listed at p. 78 of the 1946 Year Book.

Northwest Territories.—The Government of the Northwest Territories is vested in a Commissioner, assisted by a Council composed of six members all of whom are appointed by the Governor-General in Council. The administration of the various Acts, Ordinances, and Regulations pertaining to the Northwest Territories is supervised by the Director of the Lands and Development Services Branch, Department of Mines and Resources, who is also Deputy Commissioner. The seat of government is at Ottawa.

The present Territorial Council is composed of the following: Commissioner, HUGH L. KEENLEYSIDE; Deputy Commissioner, ROY ALEXANDER GIBSON; Members, ROBERT ALEXANDER HOEY, STUART TAYLOR WOOD, JOHN G. McNIVEN, LOUIS DE LA C. AUDETTE, and HAROLD B. GODWIN; Secretary, JAMES GOLDWIN WRIGHT.

Section 3.—Dominion-Provincial Relations*

The genesis of the current phase of Dominion-Provincial relations was the Dominion-Provincial Conference of December, 1936. At that time drought and depressed prices had led the Government of Alberta into partial default on its outstanding debt, and the Governments of Saskatchewan and Manitoba made clear at the Conference that in default of assistance they would be forced to take similar action. On the invitation of the Dominion Minister of Finance and the Premiers of the three Prairie Provinces, the Bank of Canada undertook an examination of their financial positions. The Bank's report on Manitoba was made public on Feb. 15, on Saskatchewan on Mar. 15, and on Alberta on Apr. 7, 1937. The Bank Report recommended certain interim financial assistance from the Dominion Government but concluded that no solution seemed possible other than that which might be provided by a complete inquiry into the financial powers and responsibilities of Canadian governing bodies at all levels. In addition to the special difficulties of the Prairie Provinces, the burden of relief had weakened the financial position of all provincial and municipal governments, and had finally proved completely beyond their capacity to bear in its entirety.

* Prepared by D. A. Skelton, Research Adviser, Bank of Canada, Ottawa.

Royal Commission on Dominion-Provincial Relations.—By P.C. 1908, on Aug. 14, 1937, the Royal Commission on Dominion-Provincial Relations was established. The Chairman was the Hon. N. W. Rowell, Chief Justice of Ontario, and the members were the Hon. Thibaudeau Rinfret, Justice of the Supreme Court of Canada, Dr. J. W. Dafoe of Winnipeg, Dr. R. A. MacKay of Dalhousie University, and Professor H. F. Angus of the University of British Columbia. Subsequently the Hon. Justice Rinfret was compelled to retire owing to ill health and was replaced by Dr. Joseph Sirois of Quebec. Illness also forced the resignation of Chief Justice Rowell in 1938 and Dr. Sirois was appointed Chairman to succeed him. The Commission has consequently been generally known as the Rowell-Sirois or Sirois Commission. The report, submitted on May 3, 1940, recommended important financial and jurisdictional changes,* of which the chief were: (1) exclusive Dominion jurisdiction in income tax, corporation tax and succession duty fields; (2) acceptance by the Dominion of responsibility for relief to able-bodied unemployed; (3) assumption by the Dominion of net provincial debt charges; and (4) payment by the Dominion of national adjustment grants designed to put each Provincial Government in a position to provide average standards of services without imposing higher than average rates of taxation.

Dominion-Provincial Conference, January, 1941.—A Dominion-Provincial Conference was called in January, 1941, to consider the Royal Commission Report. The Conference broke down on the second day in the face of opposition from the Premiers of Ontario, British Columbia and Alberta.

Wartime Tax Agreements.—Later in the year the Dominion Government proposed that, in order to meet the exigencies of the War, the Provincial Governments (and their municipalities) should suspend imposition of income taxes and corporation taxes for the duration of the War and one year after, and be reimbursed by the Dominion on the basis of either the 1940 revenues of the particular province from these sources, or the amount of that province's net debt service less succession duty collections in 1940. There were also some relatively small fiscal-need subsidies proposed and an offer to guarantee provincial gasoline tax revenues at the 1940 level. Agreements were negotiated with all the Provincial Governments in 1941 and the necessary legislation was passed in the spring of 1942. Under these agreements, which brought into effect an important part of the Sirois Report recommendations for the duration of the War, the Dominion was given a free hand in the income and corporation tax fields and developed these sources of revenue very substantially as an aid both in financing the War and in combating inflation. The other chief problems with which the Sirois Report dealt, such as provincial debts and unemployment and agricultural relief, were shelved for the time being.

Dominion-Provincial Conference, 1945-46.—Since the Wartime Tax Agreements were of temporary duration only and since a number of the pre-war financial and constitutional problems promised to arise in even more aggravated form upon the termination of these agreements, the Dominion formulated proposals for a new agreement. These proposals were submitted at a Dominion-Provincial Conference called in August, 1945. They were broader in scope than the Sirois Report recommendations, primary stress being placed on the maintenance of a high and stable level of employment and income. To this end not only important fiscal changes but also greatly developed public investment and social security policies were sug-

* See Canada Year Book 1940, pp. 1157-1163.

gested. The agreement was proposed initially for a three-year period and would involve no constitutional changes, although there was one recommendation for a constitutional amendment to provide for delegation of powers from the Dominion Government to a Provincial Government or vice versa whenever desired by both Governments.

The fiscal proposals were that the provinces should withdraw from the personal income tax, corporation tax and succession duty fields in return for annual subsidies which would not fall below a guaranteed minimum and which would rise proportionally with population and increases in per capita gross national product. The amount of the subsidies proposed was approximately 50 p.c. above provincial receipts under the Wartime Tax Agreements.

The public investment proposals outlined a substantial expansion in the Dominion program for natural resource development, conservation, and public works, and also a large increase in Dominion assistance to provincial services and construction projects either through joint participation or by grants-in-aid. Particular emphasis was put upon, and tangible encouragement offered to, the advance planning of works and, in so far as practicable, the timing of public investment expenditures with a view to helping to stabilize employment and offset fluctuations in the business cycle.

The social security proposals were among the most extensive undertaken by any country. Family allowances had already been put into effect in 1945. The Dominion now proposed, in addition, to pay a \$30 a month old-age pension without a means test to everyone 70 years of age or over; to contribute 50 p.c. to provincially administered old-age assistance under a means test for people from 65 to 69; to make grants to the Provincial Governments for general preventive public-health work and for the prevention and cure of tuberculosis, mental diseases, venereal disease, and other specific ills; to contribute approximately 60 p.c. of the cost of provincially administered health-insurance schemes; to make low-interest loans for hospital construction; to provide assistance for all unemployed able and willing to work, not covered by unemployment insurance, at the scale of approximately 85 p.c. of the unemployment insurance benefits; to provide and assist in the provision of greatly expanded vocational training and other rehabilitation services to improve employability.

The Dominion-Provincial Conference in August adjourned, after five days' discussion, to consider the proposals and any alternatives or amendments to them. A Co-ordinating Committee under the chairmanship of the Prime Minister of Canada, consisting of three Dominion Ministers and the nine Provincial Premiers, was established and subsequently held three meetings in camera from Nov. 26 to Nov. 30, 1945, from Jan. 28 to Feb. 1, 1946, and on Apr. 25 and 26, 1946. An Economic Committee, consisting largely of technical representatives of the different Governments, was also established and met for three weeks in December, 1945, and January, 1946, for the exchange of information and the development and clarification of the proposals in detail. The Economic Committee under its terms of reference made no collective report, but its members reported to their respective Governments. The Co-ordinating Committee reported back to a full plenary session of the Dominion-Provincial Conference when it reassembled on Apr. 29, 1946.

The Dominion put forward a number of modifications that had been made in its original proposals in the light of discussions in the Co-ordinating Committee. The most important of these were: an increase in the guaranteed minimum annual subsidy from \$12 per capita to \$15; an optional provision in connection with succession duties which would enable any province that wished to continue levying succession duties subject to an adjustment in its annual subsidy and with provision for offsetting credits to the taxpayer; and an expression of willingness by the Dominion to withdraw from certain tax fields as requested by some of the Provincial Governments in return for an adequate financial equivalent.

By this time submissions in relation to the Dominion proposals had been made by all the Provincial Governments. Most of these submissions accepted the Dominion proposals in principle but contained a number of suggested modifications. The submission of the Government of Ontario suggested an alternative approach and differed in principle on some important issues. After five full days of discussion it was found that too wide a gap existed to enable an agreement to be reached at that time and the Conference adjourned *sine die*. The Dominion advised that it would have to proceed with the formulation of its Budget policies in the light of these circumstances.

The Budget Proposals of June, 1946.—The Budget of June 27, 1946, included proposals for a tax agreement which could be entered into by any individual province. In compliance with the Wartime Tax Agreements, the Dominion undertook to reduce the standard corporation income tax from 40 p.c. to 30 p.c. and also to reduce personal income taxes for 1947. The Dominion would also give a tax credit of the amount of personal income tax paid any province up to 5 p.c. of the tax payable to the Dominion. The Dominion proposed to double its succession duty tax, but to provide a credit against this tax of the amount of succession duties paid to a Provincial Government up to 50 p.c. of the Dominion tax. If a province was prepared to agree to withdraw from income tax, corporation tax and succession duty fields for five years, the Dominion would undertake to pay the annual per capita subsidy under the terms proposed at the Conference. Agreeing provinces might levy a 5 p.c. tax on net corporate income within the province to be collected by the Dominion as agent for the province. The proceeds of this tax would be deducted from the annual subsidy, and in the event a province did not wish to levy this tax an amount equivalent to the estimated yield of such a tax would be deducted.

The objective of the Budget proposals was to secure tax agreements with the provinces, but the proposals were designed to enable a province which might prefer to continue its own taxation to do so without unduly penalizing its taxpayers.

Dominion-Provincial Tax Agreements.—Following the Budget Address several provinces entered into negotiations with the Dominion. During the course of these negotiations the formula on which Dominion payments to the provinces would be based was expanded and modified. Under the modified formula every province entering the agreement has a guaranteed minimum annual payment which is subject to adjustment upward for increases in provincial population and in gross national product per capita. For the Province of Prince Edward Island the guaranteed minimum is \$2,100,000. All other provinces have the choice of either one of the following two formulæ for determining their guaranteed minimum annual payment: (1) a combination of \$12.75 per capita of 1942 population, plus 50 p.c. of provincial income and corporation income tax receipts in 1940, plus the statutory

subsidies; or (2) \$15 per capita of 1942 population, plus the statutory subsidies. Option (1) proves to be the more favourable in the case of New Brunswick, Quebec, Ontario, Manitoba, Alberta and British Columbia while option (2) proves more favourable to Nova Scotia and Saskatchewan.

If all provinces should conclude agreements with the Dominion, and assuming that each took the option more favourable to it, the guaranteed minimum annual payment to each province and the amount payable in 1947, as estimated at July, 1947, as compared with the total receipts under the Wartime Tax Agreements and from succession duties and statutory subsidies would be as follows:

	<i>Proposed Agreement</i>		<i>Total Annual Receipts during Wartime from Wartime Tax Agreements, Succession Duties, and Statutory Subsidies</i>
	<i>Guaranteed Minimum</i>	<i>Estimated 1947</i>	
	\$'000,000	\$'000,000	\$'000,000
Prince Edward Island.....	2.1	2.3	1.2
Nova Scotia.....	10.9	12.1	4.2
New Brunswick.....	8.8	9.5	4.8
Quebec.....	56.4	63.4	31.3
Ontario.....	67.2	74.4	44.3
Manitoba.....	13.5	14.5	8.0
Saskatchewan.....	15.3	15.8	8.2
Alberta.....	14.2	15.3	8.2
British Columbia.....	18.1	21.4	14.3
TOTALS.....	206.5	228.7	124.5

The Dominion Government on Mar. 31, 1947, in accordance with its undertaking, discontinued its wartime tax of 3 cents a gallon on gasoline, leaving this field of taxation which was yielding the Dominion approximately \$35,000,000 annually, entirely to the provinces. Following this, in 1947, all the provinces increased their rates of taxation on gasoline as follows: Manitoba, Saskatchewan and Alberta 2 cents per gallon; Prince Edward Island, Nova Scotia, New Brunswick, Quebec, Ontario and British Columbia 3 cents per gallon.

Seven provinces—Prince Edward Island, Nova Scotia, New Brunswick, Manitoba, Saskatchewan, Alberta and British Columbia—have concluded agreements to rent their corporation tax, income tax and succession duties fields to the Dominion for five years, terminating Mar. 31, 1952, in exchange for the payments indicated above. These agreements were confirmed by legislation passed in the Dominion and Provincial Houses in 1947. On the other hand, the Governments of Ontario and Quebec announced in March, 1947, their budget proposals for the fiscal year 1947-48. These proposals included a 7 p.c. corporation tax, the maintenance of existing succession duties, and no personal income tax. At the time of its Budget announcement, the Government of Ontario made it clear that it would like to see the Dominion-Provincial Conference reconvened in the hope of arriving at a general tax agreement. The Dominion Government has committed itself to holding a Dominion-Provincial Conference to deal with the social security and public investment proposals of the 1945 Conference as soon as tax agreements are concluded with all provinces.

On Nov. 17, 1947, the Dominion Government announced the elimination of the 8 p.c. sales tax on electricity and gas used for domestic purposes.

Several other points in connection with the agreements are worthy of mention. First, special payments were made to the Maritime Provinces to fill in the so-called

gap in their case between the beginning of the new agreements, Apr. 1, 1947, and the end of the old wartime tax agreements: Oct. 31, 1946, in the case of New Brunswick; Nov. 30, 1946, in the case of Nova Scotia; and Dec. 31, 1946, in the case of Prince Edward Island. Secondly, if an agreeing province proceeds to take over the whole or any part of the business or undertaking or assets of a corporation and thus serves to reduce the tax revenues which the Dominion would otherwise obtain, a corresponding reduction will be made from the annual amounts otherwise payable to such province. Thirdly, in respect of natural resources, the agreement does not prevent the imposition of royalties and rentals by the province, since these are not regarded as taxes when they are of a nature conforming with the definitions set forth in the agreement. Further, the agreement specifically allows the imposition of taxes on income derived from logging and mining operations, as defined, without any deduction from the payment to the province. Also, under an offer ancillary to the agreement, but which applies to all provinces, whether agreeing or not, the Dominion is authorized to pay to the province one-half of the Dominion's net collections of tax on the income of certain specified public utility corporations resulting from the distribution to the public or the generation for distribution to the public of electricity, gas or steam in the province concerned.

Adjustment of Indebtedness and Natural Resources Claims of the Western Provinces.—The Dominion and the Western Provinces reached a settlement, effective July 1, 1947, concurrently with the tax agreements but not as a part of them, which covered the Treasury Bill indebtedness of these Provinces and the claims of Alberta and Saskatchewan regarding natural resources. The results of the settlement are summarized as follows:—

<i>Item</i>	<i>Manitoba</i>	<i>Saskatchewan</i>	<i>Alberta</i>	<i>British Columbia</i>	<i>Total</i>
	\$	\$	\$	\$	\$
Total Treasury Bill debt.....	24,734,452	80,361,852 ¹	26,212,000	34,031,219	165,339,523
Treasury Bills for capital and ordinary governmental purposes.....	13,855,101	13,414,441	15,617,000	17,346,838	60,233,379
Treasury Bills for direct and agricultural relief.....	10,879,351	61,221,227	10,595,000	16,684,381	99,379,960
Amount to be cancelled—					
(1) Half of above item.....	5,439,676	30,610,614	5,297,500	8,342,191	55,416,164
(2) Capitalized relief interest.....	—	5,726,184	—	—	—
To be repaid in cash out of proceeds of Natural Resources Settlement (calculated as of June 30, 1947).....	—	8,031,250	8,031,250	—	16,062,500
Amount to be refunded without interest..	5,439,676	30,610,614	5,297,500	8,342,191	49,689,980
Amount to be refunded with interest.....	13,855,101	5,383,191	7,585,750	17,346,838	44,170,879

¹ Excluding Treasury Bills covering 1935 seed-grain loans refunded in 1945; original amount \$16,468,852; amount presently outstanding \$10,051,708.

The Treasury Bill indebtedness was incurred during the depression and drought period of the 1930's. The natural resources claim covered the period 1905 to 1930 during which time the Dominion had administration and control. The general principles of the settlement are as follows: (1) that part of the Treasury Bill indebtedness of the province which represents borrowing for purposes other than direct relief or agricultural relief is to be retired over a period of thirty years by an equal annual payment representing amortization of principal and interest at 2½ p.c., which is approximately the cost of borrowing by the Dominion for a comparable period; and (2) half of that part of the total Treasury Bill indebtedness of the province which represents borrowing for direct relief and agricultural relief will be written off and

the remaining half will be refunded on a basis requiring the retirement of the total amount by equal annual instalments over a period of thirty years without interest. In the case of Saskatchewan, the amount cancelled includes a certain amount of capitalized interest in respect of relief Treasury Bills.

PART III.—CANADA'S EXTERNAL RELATIONS

Section 1.—Canada's Growth in External Status

The evolution of Canada in its external relations is reflected in the growth of its Department of External Affairs. A review of the organization and development of that Department is given at pp. 74-79 of the 1945 edition of the Year Book.

Section 2.—Canada and the United Nations*

An outline of the organization of the United Nations and Canada's place therein appears at pp. 82-86 of the 1946 Year Book. A continuation of that material is given below.

Canadian Contribution During 1947

During the year 1947 the United Nations continued to develop the subsidiary organs necessary to carry out its many political, social and economic responsibilities. While this process of constitutional development was going on, a good deal was also accomplished in the drafting of preliminary surveys of particular problems, in the detailed discussion of these problems by the delegates and in the passage of resolutions recommending the adoption by Member States of certain common policies. The United Nations met its most difficult problems in the political field. Basic disagreements as to voting procedure in the Security Council and political antagonisms among the Permanent Members hampered the objective consideration of disputes and the firm handling of them by the Council.

Canada continued its policy of consistent support to the United Nations during 1947. Canadian statesmen emphasized that the only real hope for world peace lay in the achievement of collective security. They admitted the many weaknesses of the United Nations but insisted that the Member Nations should begin with vigour and imagination to eliminate these weaknesses. In the face of Security Council weaknesses, Canada accepted membership in the Council and prepared to make its contribution to the effective functioning of that body. At the same time Canadian delegates to the General Assembly made it clear that, if the Security Council could not fulfil its responsibilities adequately, the General Assembly should make greater use of its functions in the field of international security.

Second Session of the General Assembly, Sept. 19, 1947.—The Rt. Hon. L. S. St. Laurent, M.P., Secretary of State for External Affairs, was the Chairman of the Canadian Delegation to the General Assembly and the Rt. Hon. J. L. Ilsley, M.P., Minister of Justice, was associated with him in the leadership of the Delegation. Members of the Senate, House of Commons, Department of National Health and Welfare and the Department of External Affairs completed the Canadian Delegation. Four Parliamentary advisers from the Opposition parties in Parliament assisted the Delegation. Other advisers were drawn from the Departments of National Defence, Finance and External Affairs.

* Prepared by United Nations Division, Department of External Affairs, Ottawa.

The problem of Palestine was the most serious political issue confronting the Second Session of the General Assembly. This matter had already been considered at a Special Session of the General Assembly which began on Apr. 28, 1947. A Special Committee on Palestine was created and instructed to prepare for consideration at the next regular session of the Assembly a report on the question of Palestine. Canada was one of the eleven nations chosen to provide a member for the Special Committee. The Canadian member supported the majority recommendation of this Committee for a plan of partition with economic union. A minority recommended the formation of a federal state.

At the Second Session of the General Assembly, therefore, these recommendations of the Special Committee on Palestine were considered by an *ad hoc* Committee along with a plan introduced by the Arab nations for an independent unitary state. Each of these plans was considered by a separate sub-committee and a third sub-committee was appointed to explore the possibility of conciliation between the contending parties. The General Assembly finally approved the recommendation of the *ad hoc* Committee that Palestine be partitioned into independent Arab and Jewish states and that Jerusalem be placed under a Special International Regime, all parts of the country to form an economic union. The Assembly set up the Palestine Commission to supervise the steps leading to this objective. This Commission was to be guided by and report to the Security Council in the interval between meetings of the Assembly.

The proposal to create an Interim Committee of the General Assembly to meet during the recess of the main body was supported by the Canadian Delegation, which assisted in drafting the resolution accepted by the necessary two-thirds majority of the Assembly. The Canadian Delegation made important contributions to a resolution regarding war propaganda, which was accepted unanimously by the Assembly. Other important political results of the Session were the establishment of a Special Balkan Committee, the election of Argentina, the Ukraine, and Canada to the Security Council, the admission of Yemen and Pakistan to membership in the United Nations and the establishment of a Temporary Commission on Korea, to which Canada was appointed.

In the economic field, agreements with five specialized agencies* were approved; the applications of Austria and Italy for membership in the International Civil Aviation Organization were accepted. Resolutions were adopted recommending the preparation by the United Nations of periodic reports on world economic conditions. It was agreed to study the factors bearing upon the establishment of an Economic Commission for the Middle East.

The General Assembly in dealing with social matters approved an appropriation of \$670,000 for an Advisory Social Welfare Services Program. The action taken by the Economic and Social Council and the International Labour Organization to formulate definite principles regarding trade union rights was confirmed. A resolution was accepted inviting Member States not to assist illegal immigration and urging measures to encourage voluntary repatriation and the settlement of a fair share of non-repatriable persons in each Member State. The Assembly urged the acceptance by Member States of the constitution of the World Health Organization at the earliest possible date.

* International Telecommunications Union, Universal Postal Union, World Health Organization, International Bank for Reconstruction and Development, and International Monetary Fund.

The discussion of legal matters resulted in the adoption of resolutions regarding the surrender and punishment of war criminals, the establishment of an International Law Commission for the purpose of codifying international law, the preparation by the Economic and Social Council of a draft convention on genocide, and the approval of a convention on the privileges and immunities of specialized agencies.

To finance the United Nations, a budget of \$34,825,195 was adopted. Canada joined in approving this budget. The scale of contribution for members was essentially the same as for 1946, Canada's share being 3.2 p.c. of the total.

Economic and Social Activities.—Canada is one of the eighteen members of the Economic and Social Council, having been elected in January, 1946, for a period of three years. Two sessions, the fourth and fifth, were held in 1947.

At the Fourth Session, held in New York, U.S.A., from Feb. 28 to Mar. 29, important decisions were taken in matters of policy. The earlier sessions were concerned largely with organization. Reports from eight of the nine functional commissions of the Council were presented containing recommendations for decision and action by the Council. Canada attended meetings of five of these commissions during the year.

The greatest achievement of the Fourth Session was the establishment of an Economic Commission for Europe and an Economic Commission for Asia and the Far East; these proposals were supported by the Canadian Delegation. Both regional commissions are of a temporary character, designed to conduct studies, to initiate action, and to participate in measures adopted by the United Nations as a whole.

At its Fifth Session the Economic and Social Council appointed an *ad hoc* Committee which reported favourably to the Second Session of the General Assembly regarding the establishment of an Economic Commission for Latin America. Important recommendations were made regarding the question of voting rights of these States which are not members of the United Nations but which attend United Nations international conferences.

One of the major functions assigned to the Economic and Social Council by the Charter is the co-ordination of the activities of the Specialized Agencies. To aid in the discharge of this function the Council may enter into agreements with the Agencies. Nine agreements have so far been approved. Canada is a member of all these Agencies and has approved all the agreements with the United Nations.

Among the most important achievements of the year in this field were the completion of a draft Charter for the proposed International Trade Organization, and the opening stages of a World Trade Conference at Havana, Cuba, during November and December where the principles of this Charter were discussed. A General Agreement on Tariffs and Trade had been signed earlier in the year by 23 governments (including that of Canada) which agreed to substantial reductions in tariffs.

The Canadian Delegate to the Fourth Session of the Council was Dr. G. F. Davidson, Deputy Minister of National Health and Welfare (Welfare) and at the Fifth Session Canada was represented by the Hon. Paul Martin, Minister of National Health and Welfare.

While the Economic and Social Council brings into focus the widespread activities of international organizations, most of the work in this field is accomplished by the Specialized Agencies.

The Canadian Government also contributed international relief. From a \$20,000,000 fund set aside for international relief on the termination of UNRRA, Canada gave \$5,000,000 to the International Children's Emergency Fund and \$11,000,000 for work in Austria, Greece and Italy. Another outstanding contribution was made by Canadian participation in the Preparatory Commission of the International Refugee Organization, which has taken responsibility for the maintenance and repatriation or resettlement of refugees and displaced persons.

PART IV.—DIPLOMATIC REPRESENTATION*

Section 1.—Representatives of Canada in Other Countries

Subsection 1.—British Commonwealth Countries

United Kingdom: (Established 1880.)

High Commissioner for Canada in the United Kingdom: MR. N. A. ROBERTSON (Sept. 17, 1946). Previous High Commissioners:—

SIR ALEXANDER GALT, 1880-83

SIR CHARLES TUPPER, 1884-87, 1888-96

LORD STRATHCONA AND MOUNT ROYAL, 1896-1914

SIR GEORGE PERLEY, 1917-22 (Acting 1914-17)

THE HON. P. C. LARKIN, 1922-30

THE HON. G. HOWARD FERGUSON, 1930-35

THE RT. HON. CHARLES VINCENT MASSEY, 1935-46.

Address: Canada House, Trafalgar Square, London, S.W. 1.

Australia: (Established 1939.)

High Commissioner for Canada in Australia: MR. KENNETH A. GREENE (March, 1947). Previous High Commissioners:—

MR. CHARLES J. BURCHELL, 1939-41

MAJOR-GENERAL VICTOR ODLUM, 1941-42

THE HON. THOMAS C. DAVIS, 1942-46.

Address: State Circle, Canberra.

New Zealand: (Established 1940.)

High Commissioner for Canada in New Zealand: DR. A. RIVE (June 1, 1946). Previous High Commissioner: DR. W. A. RIDDELL, 1940-46.

Address: Government Life Insurance Building, Customs Quay, Wellington.

South Africa: (Established 1940.)

High Commissioner for Canada in the Union of South Africa: MR. E. D. MCGREER (Nov. 6, 1946). Previous High Commissioners:—

DR. HENRY LAUREYS, 1940-44

MR. CHARLES J. BURCHELL, 1944-45

MR. J. C. MACGILLIVRAY, 1945-46 (Acting).

Address: 24 Barclays Bank Building, Church Square, Pretoria.

* Revised by the Department of External Affairs, Ottawa, as at June 30, 1948. Subsequent appointments to date of going to press are given in Chapter XXXII, the Annual Register. An annual review of the organization and activities of Canadian Government representation abroad is contained in the Report of the Department of External Affairs, which may be obtained from the King's Printer, Price 10 cents.

Ireland: (Established 1940.)

The High Commissioner for Canada in Ireland: The HON. W. F. A. TURGEON (Nov. 6, 1946). Previous High Commissioners:—

MR. JOHN H. KELLY, 1940-41

MR. J. D. KEARNEY, 1941-45

MR. MERCHANT M. MAHONEY, 1945-46.

Address: 92 Merrian Square, West, Dublin.

Newfoundland: (Established 1941.)

The High Commissioner for Canada in Newfoundland: MR. P. A. BRIDLE (Acting). Previous High Commissioners: —

MR. CHARLES J. BURCHELL, 1941-44.

MR. J. SCOTT MACDONALD, 1944-48.

Address: Circular Road, St. John's.

India: (Established 1946.)

High Commissioner for Canada in India: MR. J. D. KEARNEY (Dec. 23, 1946).

Address: 4 Auranczeb Road, New Delhi.

Subsection 2.—Foreign Countries

EMBASSIES AND LEGATIONS

Argentina: (Established 1941.)

Ambassador: MR. WARWICK F. CHIPMAN (presented Letter of Credence Oct. 1, 1945). Previous Minister: The HON. W. F. A. TURGEON, 1941-44. *Chargé d'Affaires ad interim:* MR. K. P. KIRKWOOD, 1944-45.

Address: Bartolome Mitre, 478, Buenos Aires.

Belgium: (Established 1939.)

Ambassador: MR. VICTOR DORE (presented Letter of Credence Jan. 21, 1947). Previous Representatives:—

Ministers:—

MR. JEAN DESY, 1939-40

MAJOR-GENERAL GEORGE P. VANIER, 1943-45.

Chargé d'Affaires ad interim:—

MR. PIERRE DUPUY, 1940-43.

Ambassador:—

The HON. W. F. A. TURGEON, 1945-47.

Address: 46 Montoyer Street, Brussels.

Brazil: (Established 1941.)

Ambassador: MR. J. S. MACDONALD (presented Letter of Credence June 3, 1948). Previous Ambassador: MR. JEAN DESY, 1944-47. MR. JEAN DESY was Minister from 1941 until 1944.

Address: Avenida President Wilson, 165, 7th Floor, Rio de Janeiro.

Chile: (Established 1942.)

Ambassador: MR. C. F. ELLIOTT (presented Letter of Credence Apr. 3, 1947).

Previous Representatives:—

Ministers:—

The HON. W. F. A. TURGEON, 1942-43

MR. WARWICK F. CHIPMAN, 1943-44.

Ambassador:—

MR. WARWICK F. CHIPMAN, 1944-46.

Chargé d'Affaires ad interim:—

MR. JULES LEGER, 1945-46.

Address: Bank of London and South America Building, Santiago.

China: (Established 1942.)

Ambassador: The HON. T. C. DAVIS (presented Letter of Credence May 21, 1947). *Previous Ambassador:* MAJOR-GENERAL VICTOR W. ODLUM, 1942-46.

Address: No. 3 Ping Tsang Hsiang, Nanking.

Cuba: (Established 1945.)

Minister: MR. C. P. HEBERT (presented Letter of Credence Mar. 16, 1948).

Previous Minister: MR. EMILE VAILLANCOURT, 1945-48.

Address: Avenida de las Misiones No. 17, Havana.

Czechoslovakia: (Established 1942.)

Minister: MAJOR-GENERAL GEORGE P. VANIER (appointed Nov. 30, 1942).

Chargé d'Affaires ad interim: MR. R. M. MACDONNELL (appointed February, 1947).

Address: Krakowska 22, Prague.

Denmark: (Established 1946.)

Minister: DR. HENRY LAUREYS (presented Letter of Credence July 12, 1947).

Previous Minister: MR. J. D. KEARNEY, 1946-47.

Address: Osterbrogade 26, Copenhagen.

France: (Established 1928.)

Ambassador: MAJOR-GENERAL GEORGE P. VANIER (presented Letter of Credence Dec. 20, 1944). MAJOR-GENERAL GEORGE P. VANIER was Minister from 1938 until 1944. *Previous Minister:* The HON. PHILIPPE ROY, 1928-38.

Address: 72 Foch Avenue, Paris.

Greece: (Established 1943.)

Ambassador: MAJOR-GENERAL THE HON. L. R. LAFLECHE (presented Letter of Credence Sept. 28, 1945). *Previous Minister:* MAJOR-GENERAL GEORGE P. VANIER, 1943-45.

Address: 31 Queen Sofia Boulevard, Athens.

Italy: (Established 1947.)

Ambassador: MR. JEAN DESY (presented Letter of Credence June 26, 1948). MR. JEAN DESY was Minister from October, 1947, until June, 1948.

Address: Saverio Mercadante 15, Rome.

Luxembourg: (Established 1945.)

Minister: MR. VICTOR DORE (presented Letter of Credence Mar. 4, 1947).

Previous Minister: THE HON. W. F. A. TURGEON, 1945-47.

Address: 46 Montoyer Street, Brussels.

Mexico: (Established 1944.)

Ambassador: MR. S. D. PIERCE (presented Letter of Credence July 17, 1947).

Previous Ambassadors:—

THE HON. W. F. A. TURGEON, 1944-45

DR. H. L. KEENLEYSIDE, 1945-47.

Address: Edificio Internacional, Paseo de La Reforma, No. 1, Mexico City.

Netherlands: (Established 1939.)

Ambassador: MR. PIERRE DUPUY (presented Letter of Credence Mar. 18, 1947).

MR. PIERRE DUPUY was Minister from 1945 until 1947. Previous Ministers:—

MR. JEAN DESY, 1939-40

MAJOR-GENERAL GEORGE P. VANIER, 1943-45.

Chargé d'Affaires ad interim:—

MR. PIERRE DUPUY, 1940-43.

Address: Sophialaan 1A, The Hague.

Norway: (Established 1943.)

Minister: MR. E. J. GARLAND (presented Letter of Credence Oct. 21, 1947).

Previous Ministers:—

MAJOR-GENERAL GEORGE P. VANIER, 1943-46

MR. J. D. KEARNEY, 1946-47.

Address: Fridtjof Nansens Place, 5 Oslo.

Peru: (Established 1944.)

Ambassador: MR. J. A. STRONG (presented Letter of Credence June 21, 1947).

Previous Ambassador: DR. HENRY LAUREYS, 1944-47.

Address: Edificio Boza, Plaza San Martin, Lima.

Poland: (Established 1942.)

Minister: MAJOR-GENERAL GEORGE P. VANIER (appointed Nov. 30, 1942).

Chargé d'Affaires ad interim: MR. K. P. KIRKWOOD (appointed February, 1947).

Address: Hotel Bristol, Warsaw.

Sweden: (Established 1947.)

Minister: Vacant. *Chargé d'Affaires ad interim:* MR. F. H. PALMER (appointed February, 1947).

Address: Strandvägen 7-C.

Switzerland: (Established 1947.)

Minister: MR. L. D. WILGRESS (presented Letter of Credence Oct. 21, 1947).

Address: Thunstrasse 95, Berne.

Turkey: (Established 1947.)

Ambassador: MAJOR-GENERAL VICTOR W. ODLUM (presented Letter of Credence Nov. 26, 1947).

Address: 211 Ayranci Baglari Kavaklidere, Ankara.

Union of Soviet Socialist Republics: (Established 1942.)

Ambassador: Vacant. *Chargé d'Affaires ad interim:* MR. J. W. HOLMES (appointed March, 1947). Previous Ambassador: MR. L. D. WILGRESS, 1942-47.

Address: 23 Starokonyushny Pereulok, Moscow.

United States of America: (Established 1927.)

Ambassador: MR. H. H. WRONG (presented Letter of Credence Nov. 8, 1946). Previous Representatives:—

Ministers:—

THE RT. HON. CHARLES VINCENT MASSEY, 1927-30

THE HON. W. D. HERRIDGE, 1931-35

THE HON. SIR HERBERT MARLER, 1936-39

MR. LORING C. CHRISTIE, 1939-41

THE HON. LEIGHTON G. MCCARTHY, 1941-43.

Ambassadors:—

THE HON. LEIGHTON G. MCCARTHY, 1943-44

MR. L. B. PEARSON, 1944-46.

Address: 1746 Massachusetts Avenue, Washington, D.C.

Yugoslavia: (Established 1948.)

Minister: MR. E. VAILLANCOURT (presented Letter of Credence Feb. 26, 1948).

Address: Belgrade.

MILITARY AND LIAISON MISSIONS**Germany:**

Head of Military Mission: Lieutenant-General Maurice Pope.

Address: Commonwealth House, 40 Johannesberger St., Wilmersdorf, Berlin.

Japan:

Head of Liaison Mission: Mr. E. H. Norman.

Address: 16 Omote-Machi, 3 Chome, Akaska-Ku, Tokyo.

CONSULATES**China:**

Vice-Consuls: Mr. P. G. R. Campbell and Mr. F. G. Ballachey.

Address: 27 The Bund, Shanghai.

Portugal:

Acting Consul General: Mr. L. S. Glass.

Address: Rua Rodrigo Fonseca, 103-40, Lisbon.

United States of America:

Consul General: Mr. H. D. Scully.

Address: 620 Fifth Avenue, New York, N.Y.

Consul General: Mr. E. Turcotte.

Address: Suite 800, Daily News Building, 400 West Madison Ave., Chicago, Ill.

Consul General: Mr. Harry A. Scott.

Address: Kohl Bldg., 400 Montgomery St., San Francisco, Cal.

CONSULATES—concluded

United States of America:—concluded

Consul: Mr. James J. Hurley.

Address: 1035 Penobscot Building, Detroit 26, Mich.

Honorary Vice-Consul: Mr. A. Lafleur.

Address: Office 503, 120 Exchange Street, Portland, Me.

Venezuela:

Acting Consul General: Mr. C. S. Bissett.

Address: No. 805, Edificio America, Esquina Veroes, Caracas.

Section 2.—Representatives of Other Countries in Canada**Subsection 1.—British Commonwealth Countries****United Kingdom:** (Established 1928.)

High Commissioner for the United Kingdom: THE HON. SIR ALEXANDER CLUTTERBUCK (appointed May 29, 1946). Previous High Commissioners:—

SIR WILLIAM H. CLARK, 1928-34

SIR FRANCIS FLOUD, 1935-38

SIR GERALD CAMPBELL, 1938-41

THE RT. HON. MALCOLM MACDONALD, 1941-46.

Address: Earnscliffe, Ottawa.

Australia: (Established 1940.)

High Commissioner for the Commonwealth of Australia: THE RT. HON. FRANCIS M. FORDE (appointed Jan. 18, 1947). Previous High Commissioners:—

MAJOR-GENERAL THE HON. SIR WILLIAM GLASGOW, 1940-45

THE HON. ALFRED STIRLING, 1945-46.

Address: 24 Sussex Street, Ottawa.

New Zealand: (Established 1943.)

High Commissioner for New Zealand: THE HON. JAMES THORN (appointed May 12, 1947). Previous High Commissioner: THE HON. DAVID WILSON, 1944-47.

Address: 107 Wurtzburg Street, Ottawa.

South Africa: (Established 1938.)

High Commissioner for the Union of South Africa: THE HON. DR. P. R. VILJOEN (appointed Sept. 10, 1945). Previous Accredited Representative: MR. DAVID DE WAAL MEYER, 1938-44.

Address: 15 Sussex Street, Ottawa.

Ireland: (Established 1939.)

High Commissioner for Ireland: THE HON. JOHN J. HEARNE (appointed Aug. 18, 1939).

Address: 140 Wellington Street, Ottawa.

India: (Established 1947.)

High Commissioner for India: SARDAR THE HON. HARDIT SINGH MALIK (appointed Sept. 3, 1947).

Address: 114 Wellington Street, Ottawa.

Subsection 2.—Foreign Countries

Argentina: (Established 1941.)

Ambassador Extraordinary and Plenipotentiary: HIS EXCELLENCY DR. JUAN CARLOS RODRIGUEZ (Jan. 13, 1947).

Address: 18 Rideau Street, Ottawa.

Belgium: (Established 1937.)

Ambassador Extraordinary and Plenipotentiary: HIS EXCELLENCY A. PATER-NOTTE DE LA VAILLEE (July 20, 1945).

Address: 395 Laurier Avenue East, Ottawa.

Brazil: (Established 1941.)

Ambassador Extraordinary and Plenipotentiary: HIS EXCELLENCY DR. ACYR DO NASCIMENTO PAES (Apr. 26, 1946).

Address: 400 Wilbrod Street, Ottawa.

Chile: (Established 1942.)

Ambassador Extraordinary and Plenipotentiary: HIS EXCELLENCY GENERAL ARNALDO CARRASCO (June 5, 1947).

Address: Suite 215, 56 Sparks Street, Ottawa.

China: (Established 1942.)

Ambassador Extraordinary and Plenipotentiary: HIS EXCELLENCY LIU CHIEH (June 7, 1947).

Address: 410 Besserer Street, Ottawa.

Cuba: (Established 1945.)

Envoy Extraordinary and Minister Plenipotentiary: HIS EXCELLENCY DR. MARIANO BRULL (Nov. 2, 1945).

Address: 499 Wilbrod Street, Ottawa.

Czechoslovakia: (Established 1942.)

Chargé d'Affaires ad interim: MR. STANISLAV KLIMA (Mar. 11, 1948).

Address: 171 Clemow Avenue, Ottawa.

Denmark: (Established 1946.)

Envoy Extraordinary and Minister Plenipotentiary: HIS EXCELLENCY G. B. HOLLER (Mar. 7, 1946).

Address: 107 Sparks Street, Ottawa.

Finland: (Established 1947.)

Envoy Extraordinary and Minister Plenipotentiary: HIS EXCELLENCY URHO VILPITON TOIVOLA (Jan. 7, 1948).

Address: Chateau Laurier Hotel, Ottawa.

France: (Established 1928.)

Ambassador Extraordinary and Plenipotentiary: HIS EXCELLENCY FRANCISQUE GAY (Apr. 21, 1948).

Address: 42 Sussex Street, Ottawa.

Greece: (Established 1942.)

Ambassador Extraordinary and Plenipotentiary: HIS EXCELLENCY CONSTANTINE SAKELLAROPOULOU (Nov. 12, 1945).

Address: Chateau Laurier Hotel, Ottawa.

Iceland: (Established 1947.)

Envoy Extraordinary and Minister Plenipotentiary: HIS EXCELLENCY THOR THORS (Jan. 20, 1948).

Address: Chateau Laurier Hotel, Ottawa.

Italy: (Established 1947.)

Envoy Extraordinary and Minister Plenipotentiary: HIS EXCELLENCY COUNT CARLO FECIA DI COSSATO (Oct. 10, 1947).

Address: 384 Laurier Avenue East, Ottawa.

Mexico: (Established 1944.)

Ambassador Extraordinary and Plenipotentiary: HIS EXCELLENCY PRIMO VILLA MICHEL (Sept. 15, 1947).

Address: 11 Metcalfe Street, Ottawa.

Netherlands: (Established 1939.)

Ambassador Extraordinary and Plenipotentiary: HIS EXCELLENCY DR. J. H. VAN ROIJEN (Apr. 2, 1947).

Address: 168 Laurier Avenue East, Ottawa.

Norway: (Established 1942.)

Envoy Extraordinary and Minister Plenipotentiary: HIS EXCELLENCY DANIEL STEEN (Apr. 2, 1942).

Address: 509 Plaza Building, 45 Rideau Street, Ottawa.

Peru: (Established 1944.)

Ambassador Extraordinary and Plenipotentiary: HIS EXCELLENCY ALFREDO BENAVIDES (Mar. 29, 1945).

Address: 36 Elgin Street, Ottawa.

Poland: (Established 1942.)

Envoy Extraordinary and Minister Plenipotentiary: HIS EXCELLENCY EUGENIUSZ MILNIKIEL (Apr. 22, 1948).

Address: 183 Carling Avenue, Ottawa.

Sweden: (Established 1943.)

Envoy Extraordinary and Minister Plenipotentiary: HIS EXCELLENCY PER WIJCKMAN (Aug. 4, 1943).

Address: 720 Manor Road, Rockcliffe Park.

Switzerland: (Established 1945.)

Envoy Extraordinary and Minister Plenipotentiary: HIS EXCELLENCY DR. VICTOR NEF (Apr. 25, 1946).

Address: 5 Marlborough Avenue, Ottawa.

Turkey: (Established 1944.)

Ambassador Extraordinary and Plenipotentiary: HIS EXCELLENCY MUZAFFER GOKER (Nov. 12, 1947).

Address: Chateau Laurier Hotel, Ottawa.

Union of Soviet Socialist Republics: (Established 1942.)

Chargé d'Affaires ad interim: NIKOLAI BELOKHVOSTIKOV (Dec. 29, 1947).

Address: 285 Charlotte Street, Ottawa.

United States of America: (Established 1927.)

Ambassador Extraordinary and Plenipotentiary: HIS EXCELLENCY THE HON. RAY ATHERTON (Nov. 19, 1943).

Address: 100 Wellington Street, Ottawa.

Uruguay: (Established 1947.)

Envoy Extraordinary and Minister Plenipotentiary: HIS EXCELLENCY CESAR MONTERO DE BUSTAMANTE (Mar. 11, 1948).

Address: 7 Delaware Avenue, Ottawa.

Yugoslavia: (Established 1947.)

Envoy Extraordinary and Minister Plenipotentiary: HIS EXCELLENCY MATO JAKSIC (July 8, 1948).

Address: 259 Daly Avenue, Ottawa.

The records accumulated at the decennial censuses of Canada since the creation of the Dominion in 1867 to the latest census to date, 1941, make a valuable contribution to the demographic history of the nation. Each successive decade has added to the vast scope of the material; the detailed statistical analyses and the numerous monographs and studies available under the several aspects of demography and agriculture have made the census a most important statistical measure of accomplishment and progress.

The salient aspects of population growth under each main heading shown in the conspectus are covered but not necessarily in any one edition. The Canada Year Book can do no more than summarize the broad results of the census. More detailed information can be obtained from the census publications.

The main legal reason for a periodic census under the constitution of Canada is to determine representation in the House of Commons: this, according to the British North America Act, is based on population (see p. 85). The payment of provincial subsidies on a per capita basis is adjusted annually on population estimated from the census data. In view of this each person is counted as belonging to the locality of his regular domicile, rather than to the place he may be at the date of enumeration.

The modern Dominion-wide census, however important this redistribution purpose, has a much wider sphere of usefulness. It constitutes, through the data collected directly from the people, a true measure of the social and economic progress of the country and can therefore be used in the regulation and general administration of public affairs, social security and rehabilitation programs, etc.

History of the Census.—An outline of the history of the census is given at pp. 96-97 of the 1947 edition of the Year Book.

Growth of Population.—A brief résumé of the population history of Canada from the first census in 1666, when it numbered 3,215 persons, to the eighth Dominion Census of 1941, when the figure was 11,506,655, places Canada among the leading countries of the British Empire in the rate of population growth. The inflow of

* This Chapter has been checked by O. A. Lemieux, Director, Census (Demography) Division, Dominion Bureau of Statistics.

capital and the opening up of new and vast areas with the consequent stimulation of immigration began with the opening of the twentieth century and was the latest episode in the transformation of the central prairie region, which, in the course of forty years, has been organized into provinces and developed with such promise. The total population of Canada at the end of the nineteenth century was approximately 5,400,000; it had about doubled this figure by 1931. The general increase in the population of European countries during the entire nineteenth century was approximately three-fold; Canada equalled this rate of progress during the sixty years from 1871 to 1931.

In the decade 1901-11 immigration alone totalled 1,800,000. This figure was the main factor in the gain of 34.2 p.c. registered by the total population of Canada in that decade, which was relatively larger than the growth of any modern country during the same period.

The next decade started out with an intensification of this immigration movement, but with the outbreak of the First World War a recession set in. The effects of that War upon the Canadian population were both direct and indirect. Nearly 60,000 members of the Canadian Forces died overseas and approximately 20,000 took their discharge in the United Kingdom. To these may be added 50,000 deaths from the war plague, influenza. In addition large numbers of British Isles residents, most of them recent immigrants, left Canada to join the Armed Forces of the United Kingdom and did not return; the same is true of enemy nationals who passed in considerable numbers into the United States immediately before and after the declaration of hostilities. The fluidity of the Canadian population accordingly rendered the War costly in personnel far beyond actual casualties. However, the net result over the ten years was a population increase of 21.9 p.c. or the largest increase for any modern country in that decade with the exception of Australia where an increase of 22.0 p.c. was recorded.

The Census of 1931 showed a further increase of 18.1 p.c. over 1921. * Natural increase and immigration contributed 1,325,256 and 1,509,136, respectively, although the net gain was only 1,588,837 since estimated emigration was 1,245,555, for the ten years. Census returns of Great Britain for 1921-31 showed an increase of 4.7 p.c., equalling that of the previous decade. New Zealand in the ten-year interval 1911-21 showed an increase of 19.8 p.c. and the decade 1921-31, 19.3 p.c. A census of Australia was not taken in 1931, but the official estimate of population based on the Census of 1933 gave an increase of 19.8 p.c. as against 22.0 p.c. for the period 1911-21. Census figures for the United States showed an increase in population of 14.9 p.c. for 1910-20, 16.1 p.c. for 1920-30 and 7.2 p.c. for 1930-40.

The eighth census of Canada taken June 2, 1941, gave the population as 11,506,655 as compared with 10,376,786 as of June 1, 1931, an increase of 1,129,869 or 10.9 p.c. in the decade. During the greater part of this decade, Canada, along with all other countries, was face to face with a prolonged and severe economic depression; immigration was still further restricted by government regulations as well as by economic necessity. The figures for immigrant arrivals were actually reduced from 1,166,004 in the ten-year period 1921-31 to 140,361 in 1931-41. The natural increase for this period showed a reduction of about 7 p.c. and, since immigration was reduced more than 88 p.c. over the decade, the net increase in population was due almost entirely to the favourable birth and death rates of the established population.

CHANGES IN PERCENTAGE DISTRIBUTION OF POPULATION, CANADA

1851 - 1946

PER CENT

PART I.—STATISTICS OF GENERAL POPULATION

Section 1.—Census Statistics of General Population

Since the creation of the Dominion of Canada in 1867, decennial censuses have been taken as of Apr. 2, 1871, Apr. 4, 1881, Apr. 5, 1891, Apr. 1, 1901, June 1, 1911, 1921, 1931 and June 2, 1941. Summary figures are given in Table 1.

1.—Population of Canada, by Provinces and Territories, Decennial Census Years 1871-1941

NOTE.—The populations of the Prairie Provinces in 1906, 1916, 1926, 1936 and 1946 are shown at p. 164. Intercensal estimated populations from 1867-1904 will be found at p. 141 of the 1936 Year Book; from 1905-30 at p. 127 of the 1946 edition; and from 1931-48 in Table 4, p. 139, of the present edition.

¹ Corrected as a result of the Boundaries Extension Acts, 1912. ² Revised in accordance with the Labrador Award of the Privy Council, Mar. 1, 1927. The total for 1921 includes 485 members of the Royal Canadian Navy who were recorded separately. ³ Corrected by transfer of population of Fort Smith (368) to the Northwest Territories. ⁴ The decreases shown in the population of the Northwest Territories since 1891 are due to the separation therefrom of vast areas to form Alberta, Saskatchewan and Yukon and to extend the boundaries of Quebec, Ontario and Manitoba.

Numerical increases in the populations of the different provinces of Canada are given by decades from 1871-1941, at p. 99 of the 1947 Year Book.

Section 2.—Movement of Population

The traditional movement of population on the North American Continent from east to west has not been in evidence in the statistics of the past two decades. A somewhat spotty picture is revealed by the intercensal comparison between 1931 and 1941, by the ration book counts of 1944 and 1946 and by the special survey of interprovincial migration covering 1946-47.

The most spectacular changes are shown in the Prairie Provinces and in British Columbia. The three Prairie Provinces lost by out-migration about a quarter of a million people between 1931 and 1941 and almost the same number from 1941 to 1946. British Columbia gained—during the 1930's at the rate of about 8,000 a year and during the 1940's at about 25,000 a year. According to the most recent figures available there is no sign of a falling-off in British Columbia's growth. On an absolute basis, Ontario received almost the same number of people as British Columbia, but in relation to her larger population this growth was only a quarter as important. Quebec's net change was very small relative to its population. Nova Scotia gained during the war years and lost immediately after the War, while the Maritime Provinces as a whole lost population over the past two decades.

In the 1945 edition of the Year Book a calculation was presented* using the ration-card count of 1944 by counties to estimate rural-urban movement. Tables 2 and 3 show these results as well as a similar series for the periods Apr. 1, 1944, to Sept. 1, 1946, and June 1, 1946, to June 1, 1947. The average exodus of about 30,000 persons a year from farm counties to urban places, which was shown during the 1930's, increased to over 80,000 a year in 1941-44. Since 1944, however, no significant rural-urban movement appeared.

Section 3.—Intercensal Estimates of Population and Current Analyses

Intercensal estimates of the population serve many uses. They constitute a base for vital statistics rates, per capita figures of production and trade, and other analyses. More recently, they have proved useful for estimates of labour force and other population characteristics on data collected in sample surveys.

Estimates are constructed in the first place for the total population of Canada and each province. It is a requirement that these be made available about the date to which they apply, June 1 of each year. As final figures on the components of

* A review of the rural-urban movement of population in 1941-44, the migration between the nine provinces of Canada during the decade 1931-41, and the estimated net civilian immigration by provinces, 1941-44, appears at pp. 120-122 of the 1945 Year Book.

population change are not ready at that date, the numbers of births, deaths and immigrants are partly filled in by extrapolation so that a preliminary figure is secured for the June to May interval. To avoid a cumulative error the calculation in effect starts afresh with the latest preceding census for each year's estimates and uses the most up-to-date figures then at hand. To the census figures are added the births of the intervening years and the deaths are subtracted. Immigrants are added and emigrants are subtracted. On the last item of this calculation there is least information—it is possible to ascertain the number of Canadians entering the United States from United States immigration figures, and sometimes the same for the United Kingdom but no data for other countries are available.

The same calculation provides the estimates for the provinces year by year, with the addition that interprovincial migration for each year is now given by the June survey of the Dominion Bureau of Statistics Sampling Unit. This special 2 p.c. sample is used to fill what has hitherto been a serious gap in the annual estimates.

The program of population estimates calls for two figures to be given in respect of each year; one based on preliminary materials, as described above, necessarily involving an extrapolation of birth, death and immigration returns, and the other on final figures subject to no further change which can be made available only when the last item of subsequent information has been secured. This last item is the succeeding decennial census. There is no theoretical gain in making minor adjustments which are within the band of error to which the figures are subject in any case, and such adjustments in practice cause confusion to users. As estimates for successive years are independently calculated back to the latest census the best estimate of the balance of population change is not obtained by subtracting the figure for one year from that for the year following. As there is in fact much interest attaching to the year-to-year balance, Table 5, which gives all available data on that point, is included.

4.—Estimates of Population, by Provinces, Intercensal Years, 1931-48

NOTE.—At every census the previous post-censal data are adjusted to the newly recorded population figures. Figures for 1867-1904 will be found at p. 141 of the 1936 Year Book and for 1905-30 at p. 127 of the 1946 edition. Figures for all provinces for 1931 and 1941 are decennial census figures while those for the Prairie Provinces for 1936 and 1946 are quinquennial census figures.

¹ These estimates are subject to adjustment as later data are made available.

The present trends of growth as applied to the future are reviewed in a short analysis in the 1946 Year Book at pp. 127-128. Further details on this subject may be found in Bulletin F-4 "The Future Population of Canada", published by the Dominion Bureau of Statistics.

Population by Sex and Age.—In calculating many vital statistics rates it is necessary to know not only the total population but also the distribution by sex and age. Hitherto, such calculations have usually been restricted to the years about the census, but with the figures of Table 6 sufficient accuracy is secured for calculations of vital statistics rates.

Table 6 shows the population of Canada by sex and age for the years 1931 to 1947. The figures for 1931 and 1941 are those of the census. For the other years they are estimates, calculated from the census figures, the births and deaths in each year, and known migration into and out of the country.

The starting point in this calculation was the population of the 1931 Census. The Census was taken at the beginning of June. The number of children under one year of age on June 1 of each year was obtained by subtracting the number who had died during the previous 12 months from the number who had been born. At each other year of age, the deaths at that age were subtracted from the census figures to give an estimate of the number at the next higher age in the following year. This process was carried forward for each year to 1941, and gave what may be called the 'expected' figures of population for that year. These expected figures were then compared with the actual figures of the 1941 Census, the differences at each age noted, and the estimates for the previous years revised in the light of these differences. The differences for each year were distributed between the two sexes and the different ages in the same ratio as the differences between the actual and 'expected' figures in 1941. The sum of the differences in 1941 was about 90,000 and is believed to be largely due to unrecorded migration into and out of the country.

The estimates for the years after 1941 are being made in the same way as the estimates for the years before 1941. The figures for 1942 to 1947 will be revised after the 1951 Census; those for the years 1932 to 1940 are now final.

The population of Canada in 1931 and 1941 by sex and age is shown graphically in the Chart facing p. 226.

PART II.—CENSUS ANALYSES OF GENERAL POPULATION

Section 1.—Rural and Urban Population

The population residing in cities, towns and incorporated villages has been defined for census purposes as 'urban' and that outside of such localities as 'rural'. The distinction between rural and urban populations in Canada, therefore, is a distinction of provincial legal status rather than of size of aggregation of population within a limited area. Since the laws of the various provinces differ in regard to the population necessary before a municipality may be incorporated as urban,* the line of demarcation between rural and urban population is not uniformly drawn throughout the Dominion.

This basis of comparing rural and urban populations adhered to throughout the census analyses is adopted for Canada because the necessary comparable data over a long period of years required for comparison by degree of urbanization does not exist. Obviously, the populations of villages of less than 1,000 cannot be regarded as truly urban, although there is reason, for certain purposes, to distinguish them from the surrounding rural populations, in that they enjoy definite cultural advantages not possessed by the strictly rural municipalities.

Table 2 has been prepared to overcome some of the difficulties involved, and to provide a basis for comparison of urban centres by size with those of other countries. These data enable places outside any required size limits to be readily excluded. Similar data, by provinces, will be found in Vol. II of the Census of 1941.

* In Saskatchewan the original legislation of 1908 provided that a community of 50 persons on an area not greater than 640 acres might be incorporated. Several amendments have since been made and, as the Act now stands, 100 people resident on an area not greater than 240 acres may be incorporated. The Ontario law, on the other hand, requires that a village before it can be incorporated must have a population of 750 on an area not exceeding 500 acres.

During the latest four decades there has been a radical shifting in the distribution of the Canadian population from rural to urban district. The change has been continuous throughout the period. In the decade ended 1941 the proportion of urban population increased from 53·7 p.c. to 54·3 p.c. Urban communities absorbed nearly 60·2 p.c. of the total increase in population during that decade and the urban population of Canada in 1941 exceeded the rural by 998,177. Out of every 1,000 persons in the country, 457 were resident in rural and 543 in urban communities on June 2, 1941, as compared with 463 in rural and 537 in urban communities on June 1, 1931; 505 in rural and 495 in urban on June 1, 1921; and 546 in rural and 454 in urban on June 1, 1911. In this trend to urbanization of population, Canada is by no means unique. The same change has characterized virtually all western nations to a greater or less degree during the past century.

1.—Rural and Urban Populations, by Provinces and Territories, Census Years 1911-41

Province or Territory	1911		1921		1931		1941

¹ Royal Canadian Navy (485) included in rural total.

Table 2 gives the distribution of urban population in Canada by size of urban centres; the rural-urban trend is very strongly indicated by the increased size of the larger cities and towns at a time when immigration, which in former decades (especially that of British origin) tended to concentrate in urban centres, was negligible.

2.—Urban Populations, by Size-of-Municipality Groups, Census Years 1921-41

Montreal, the largest city in Canada, increased by 84,430 in the decade 1931-41, from 818,577 to 903,007; Toronto, the only other city of over half a million population, increased by 36,250 from 631,207 to 667,457. Vancouver and Winnipeg went up to 275,353 and 221,960, respectively; Hamilton, Ottawa and Quebec were all over 150,000; Windsor over 100,000; and the western cities of Edmonton and Calgary 93,817 and 88,904, respectively. These latter cities exceeded London, which also came in the 75,000 to 100,000 class in 1941.

All the larger cities have in their neighbourhoods growing 'satellite' towns or other densely settled areas in close economic relationship with the central municipality. It has, therefore, been advisable to calculate the total populations for the metropolitan areas of these greater cities: they are shown for 1931 and 1941 in Table 3.

3.—Populations of Greater Cities in 1941 Compared with 1931

¹ The populations of Ontario, Quebec, Manitoba and the Northwest Territories were adjusted for 1911 according to the provisions of the Boundaries Extension Acts, 1912.

² Revised in accordance with the Labrador Award of the Privy Council, Mar. 1, 1927. The total for 1921 includes 485 members of the Royal Canadian Navy who were recorded separately.

Section 3.—Sex Distribution

The sex distribution of the Canadian people has been characterized since early colonial times by a preponderance of males, although this condition has been greatly modified in more recent years. In 1666, during the early years of settlement by the French-speaking immigrants, 63·3 p.c. of the population were males. In 1784, when the English-speaking immigration to Canada was commencing, there were 54,064 males and 50,759 females and by the middle of the nineteenth century there were 449,967 males to 440,294 females in Lower Canada, and 499,067 males to 452,937 females in the more newly settled Upper Canada. Since Confederation the newer sections of Canada—the west and the northwest—have shown the greatest excess of males.

From 1871 to 1941, for Canada as a whole, the proportion of males never dropped below 51 p.c. of the total population, whereas for Western Canada it varied between 53 p.c. and 59 p.c.

¹ Includes 485 members of the Royal Canadian Navy, who were recorded separately in 1921.

Immigration has influenced the sex distribution of the population, as between provinces, in widely different degree. In the older settlements of Quebec and parts of New Brunswick and Ontario, where the populations are of French basic stock, immigration has not played as great a part in upsetting the normal distribution of the sexes as it has in the other provinces. Even in Ontario immigrants from Continental European countries do not settle as readily and are not assimilated as completely as in the newer western provinces.

A characteristic of population distribution since 1911 has been the rapid growth of urban centres due to the far-reaching developments in manufacturing that have entirely changed the economic picture. Summary figures showing the disparity between the sexes in the matter of urban concentration in 1911, 1921, 1931 and 1941 in the total population are given in the following tabulation. Where the percentage of urban males is large the percentage of females is also large. Each decade emphasizes the greater opportunities for female employment in urban centres as compared with rural.

<i>Item</i>	<i>1911</i>	<i>1921</i>	<i>1931</i>	<i>1941</i>
Excess of all males over all females per 100 of total population....	6.07	3.09	3.59	2.56

¹ White population only.

Section 4.—Age Distribution

The age distribution of a population is fundamental to most, if not all, other analyses, for the age factor influences employment, marriage, birth rates and death rates, education, immigration, criminology and a multitude of events and activities that are of great importance in the national life.

Immigration has a strong influence on age distribution: it does not directly affect the very young sections of the population except to a small degree, but it immediately affects the age groups between the 'teens' and the 'twenties' and its effects are carried to the older groups as time goes by. Thus, the influence of the very heavy immigration of the early years of the century (1900-11) is indicated by the fact that, in 1901, 175.1 persons per 1,000 of the total population were in

the age group 20-29 years and 130.5 persons per 1,000 in the group 30-39 years: a decade later, 190.3 per 1,000 were in the former group and 142.6 in the latter. Since immigration was cut down very severely after the outbreak of war in 1914, the influence of these earlier accretions to the population has crept through the upper age groups year by year until it has now reached those of the population in the 'fifties'.

Between 1931 and 1941 a more pronounced general ageing of the population is shown owing to practically non-existent migration and a lower birth rate—factors that were emphasized during the depression years. In 1921 the number per 1,000 of total population between 40 and 59 years of age was 183.0; it was 201.1 in 1931 and 209.5 in 1941. Greater proportional increases, however, are shown by the group 60 years of age or over; this group represented 75.1 per 1,000 of the total population in 1921, 83.9 in 1931 and no less than 102.1 per 1,000 in 1941.

Male and female population by age groups for the census years 1931 and 1941 together with estimates by age and sex for the intercensal years 1932-40 and 1942-47 are given in Table 6, p. 141, of the present edition. More detailed tables on this subject are given at pp. 94-96 of the 1943-44 edition of the Year Book.

Section 5.—Marital Status

Next to the sex and age distribution of a population, that of marital status is probably the most fundamental. Its incidence is twofold: 'vital' and 'economic and social'.

The vital basis lies in the influence of the marriage state on the fertility of a population and, from this angle, close analyses of marital status, by age, are important. The ages of females between 15 and 45 years have more significance than those of males; if the proportion of females in this group is small, the expected proportion of births will also be small. It has been shown that for the Canadian population the combined influences of age of the population, age of the married females, and proportion of females married has become steadily more favourable to the birth rate from 1871 to 1921 but that, since the latter date, the trend has been less favourable.

9.—Marital Status of the Population, 15 Years of Age or Over, by Sex, Census Years 1911-41

NOTE.—Figures for censuses previous to 1911 are not comparable.

Year and Sex	Single		Married		Widowed		Divorced and Legally Separated		Total ¹

¹ Includes persons whose marital status was not stated; percentages are based on stated condition.

In Canada as a whole there are more married males than married females. Other striking statistics of conjugal condition are the great preponderance of widows compared to widowers and the large and increasing numbers of divorced and legally separated persons.

Marital status of the 1941 population 15 years of age or over, by provinces and sex, is shown at p. 102 of the 1945 Year Book.

Section 6.—Racial Origins

A population composed of diverse racial stocks gives rise to political, economic and social problems quite different in nature from those of one with a small admixture of foreign elements, although, to the extent that certain racial stocks are more readily assimilated than others, the problems are mitigated. It is equally true that the different educational, moral, economic, religious and political backgrounds of a people of mixed origins lend variety and diversity to the national life.

The two basic stocks of the Canadian people are the French and the English: historically the French is much the older and, excepting at the time of the Census of 1921, has exceeded in numbers any one of the basic British Isles stocks.

¹ Includes the four original provinces of Canada only.² Includes Bohemian, Bukovinian and Slavic.³ Included under Scandinavian.⁴ Includes Lithuanian and Moravian.⁵ Includes⁶ Includes Finnish and Polish.⁷ Since 1921 Scandinavian has been divided into⁸ Includes Bukovinian, Galician and Ruthenian.⁹ Includes 35,416 half-breeds.

Racial origins of the population by provinces and territories in 1941 are given at p. 106 of the 1945 edition of the Year Book.

Section 7.—Religions

At each census the actual numbers attached to any religious denomination, as reported by the persons enumerated, have been recorded. The growth of the different denominations from an early date is traced statistically in Table 11.

11.—Religious Denominations of the Population, Census Years 1871-1941, with Percentage Distribution for 1941

¹ The figures for 1931 entered opposite "Congregationalist" and for 1931 and 1941 opposite "Presbyterian" represent the number not included in the "United Church".

² Reported as Methodist before 1931. ³ Includes 109,475 population in Manitoba, British Columbia and the Northwest Territories who were largely Indian and hence likely pagan.

⁴ Greek Orthodox and Greek Catholic combined under the term "Greek Church" in 1921. In the Censuses of 1931 and 1941, Greek Catholics are included with Roman Catholics.

⁵ Mennonites were included with Baptists in 1871 and 1881; in 1891 they were included with "other denominations".

⁶ Included with "other". ⁷ Includes 186,654 Greek Catholics

Details of leading religious denominations by provinces are given at p. 109 of the 1945 edition of the Year Book; those of the population of the nine leading cities are shown in Table 14 of the 1946 Year Book at p. 107.

Section 8.—Birthplaces

The population of Canada by broad nativity groups—Canadian born, other British born, United States born and other foreign born—is shown in Table 12.

The effects of the large immigration at the beginning of the century are seen in all columns of the percentage figures after 1901. Whereas in 1871, 83.3 p.c. of the total population were Canadian born, 14.1 p.c. other British born, and 2.6 p.c. foreign born, the corresponding proportions in 1941 were 82.5 p.c., 8.7 p.c. and 8.8 p.c., respectively.

The smallest element in the population, viz., the foreign born other than United States born, actually shows the greatest percentage increase. These "other foreign born" increased rapidly from 0.85 p.c. in 1871 to 7.5 p.c. in 1931. The decline of the group indicated for 1941 is attributable to a restricted immigration policy (see Chapter V).

Table 27, p. 113 of the 1943-44 Year Book gives, for 1941, the nativity of the population analysed by sex and province.

12.—Nativity of the Population, Census Years 1871-1941

² Includes six provinces only.

³ Includes

Table 13 gives the total population by country of birth for census years 1871-1941. The census, under birthplace, collects information on both the country of birth of the immigrant arrivals in Canada and the province of birth of the native-born population.

Comparable figures for country of birth for census periods up to 1921 and those taken more recently are difficult to obtain because of the many geographical changes in Europe after the First World War; for instance, a person who, early in the century, migrated to Canada from a certain part of Austria or Hungary might not realize

that in 1931 he should have recorded his birthplace as Poland or Roumania in line with the new national boundaries. In comparing the census figures of several decades these facts should be considered and a regrouping of certain European countries whose boundaries were changed in later censuses is carried back to earlier censuses to maintain comparability. Table 13 is as far as the census can go in supplying strictly comparable figures along these lines. In this table no change has been made affecting the census figures themselves: they have been merely regrouped geographically.

¹ Includes "birthplace not stated".

² Includes "born at sea".

³ Includes Poland.

⁴ Includes Austria, Czechoslovakia, Hungary, Yugoslavia, Poland, Galicia and Roumania.

⁵ Includes six provinces only.

More detailed information on this subject will be found at pp. 111-117 of the 1943-44 Year Book.

Section 9.—Citizenship

Until the passage of the Canadian Citizenship Act in 1946 (the Act came into force on Jan. 1, 1947), the basic legislation governing Canadian nationality was to be found in the Immigration Act. The present legislation is outlined in the Miscellaneous Administration Chapter of this edition (see Index).

Table 14 shows that, at the Census of 1941, less than 1 p.c. of the total Canadian-born and other British-born population had lost their Canadian citizenship through renunciation or marriage. Over 80 p.c. of the United States-born persons in Canada, who form 2.7 p.c. of the total population, had become Canadian citizens together with 74.7 p.c. of the Continental European-born; of those born in Asiatic countries 72.7 p.c. remained aliens. Of the total population, only 2.4 p.c. were aliens.

Section 10.—Languages and Mother Tongues

Statistics under this heading for the 1941 Census are given at pp. 122-123 of the 1947 Year Book.

Section 11.—School Attendance

Statistics under this heading for the Census date of 1941 will be found at p. 138 of the 1943-44 Year Book.

Section 12.—Blind and Deaf-Mutes

According to the standards applied by the Census, the blind in the nine provinces in 1941 numbered 9,962 or 8·7 per 10,000 of the population as compared with 3,266 or 6·1 per 10,000 at the beginning of the century. Persons who had lost the sight of one eye only were not regarded as blind.

Deaf-mutism, unlike blindness, is preponderantly an infirmity originating at birth or an early age. The number of deaf-mutes in the nine provinces of Canada increased from 5,368 in 1881 to 7,194 in 1941. The number of blind deaf-mutes in Canada was 158, of whom 63 were in Quebec, 47 in Ontario, 13 in Nova Scotia, 9 in Alberta, 8 in British Columbia, 6 in each of the Provinces of Prince Edward Island and Manitoba, and 3 in each of the Provinces of New Brunswick and Saskatchewan.

Detailed statistics of the blind and of deaf-mutes are given in Vol. IV of the 1941 Census.

Section 13.—Occupations

Figures for Canada, excluding Yukon and the Northwest Territories, show that 3,676,563 males and 833,972 females, 14 years or over, or a total of 4,510,535 persons, including members of the Armed Forces, were gainfully occupied at the time of the 1941 Census. Males represented 81.5 p.c. and females 18.5 p.c. of the total gainfully occupied. The population of the nine provinces consisted of 5,890,683 males and 5,599,030 females or a total of 11,489,713 persons. The total gainfully occupied, therefore, accounted for 39.3 p.c. of the total population; gainfully occupied males representing 62.4 p.c. of the total male population and gainfully occupied females 14.9 p.c. of the total female population. Nearly 84 p.c. of the males and about 20 p.c. of the females, 14 years of age or over, were gainfully occupied at the 1941 Census.

A more detailed summary of the occupations of the Canadian people for the 1941 Census is given at pp. 1062-1073 of the 1943-44 Year Book.

Males on Active Service not gainfully occupied prior to enlistment.....	63,518	—	—	—	—
Total.....	3,676,563	—	—	—	—

¹ Total "A" includes males on Active Service with a gainful occupation prior to enlistment.² Total "B" includes occupied males minus those on Active Service.³ Based on column 2. There is very little difference in the percentage distribution of males by occupation groups with Active Service included.⁴ Less than 0.05 p.c.⁵ This group does not include agricultural, fishing, logging, or mining labourers.

Section 14.—Dwellings, Households and Families*

Buildings and Dwellings.—According to Table 18, the number of occupied dwellings in Canada† at the 1941 Census was 2,597,969 as compared with 2,227,000* at the 1931 Census. The number of persons per dwelling was highest in Quebec at 5.1 and lowest in British Columbia at 3.7. In addition, there were 62,008 vacant dwellings in the Dominion on June 2, 1941. It should be explained that the total number of buildings used for habitation—2,181,564—was somewhat less than the number of dwellings since, in the case of apartment buildings, rows and semi-detached structures, each building would contain one or more dwellings.

Definitions of Dwellings and Dwelling Types.—The Census defines a dwelling as "a structurally separate set of self-contained living premises having its own entrance from outside the building containing it or from a common passage or stairway inside". According to this definition a single-dwelling house is a permanent structure in which there is only one self-contained dwelling unit. A semi-detached dwelling house, sometimes known as a "double house", is a two-dwelling structure with separate entrances to each dwelling, and divided by a solid partition extending from attic to cellar. This distinguishes the semi-detached from the "duplex" or two-dwelling apartment house where the division, with upper and lower apartments, is on a horizontal basis. Apartment dwellings or suites are found in apartment blocks, each dwelling having a separate exit to a common hall or landing. A flat is structurally similar to an apartment house except that each dwelling unit has an independent entrance from the outside.

Households and Families.—The number of households in the nine provinces at the 1941 Census was 2,706,089 and the average size of all households was 4.3 persons per household. Private families in Canada totalled 2,525,299, the average

* For 1931 Census figures, see p. 136 of the 1936 Year Book. The figure of 1,984,286 given there represents number of buildings containing dwellings and not the number of dwellings.

† Figures in this Section are exclusive of Yukon and the Northwest Territories.

number of persons per family being 3.9. The average size of households and of families was largest in Quebec and smallest in British Columbia.

Definitions of Household and Family.—In the Census a household is defined as “a person or a group of persons living in one housekeeping community. The persons may or may not be related by ties of kinship, but if they live together with common house-keeping arrangements, they constitute a household”. Persons on Active Service were included as members of their family households whether actually living at home or not at the date of the Census.

The family membership is restricted to persons having the husband-wife or parent-child relationship and thus is not always comparable with the group of persons composing the household. The latter often consists of two or more families and very frequently includes persons related to the head, such as uncle, niece, grandmother, and others, but who are not members of his immediate family.

¹ Buildings used for habitation only.

² Includes dwellings with tenure not stated.

Similar data on buildings, dwellings, households and families for urban centres of 30,000 population or over at the 1941 Census are given at pp. 126-127 of the 1947 Year Book. For further details concerning tenure and kind of dwellings, composition and size of family households, see pp. 121-125 of the 1946 edition.

Section 15.—Quinquennial Census of the Prairie Provinces

The Census and Statistics Act of 1905 and the Statistics Act of 1918 provide for a census of population and agriculture for the Provinces of Manitoba, Saskatchewan and Alberta, to be taken in 1906 and every tenth year thereafter, in addition to the Dominion Decennial Census.

The latest Prairie Provinces Census was taken as of June 1, 1946, and a summary of final results now available (March, 1948) is presented in this Section. These results cover such general population characteristics as sex, age, marital status, birthplace, citizenship, mother tongue, years of schooling, and migration. However, in addition to these topics, the 1946 Census provides data on agriculture, family and household composition, industries and occupations, employment and earnings, and housing. Preliminary figures dealing with these topics are being issued in bulletin form, and final figures covering all phases of the 1946 Census will later be published in the census volumes.

The population of the Prairie Provinces according to the geographic divisions known as Census Divisions is given in Table 19. These divisions have been established as permanent statistical areas, since there are no county areas in the Prairie Provinces (see map on p. 164).

Rural and Urban Population.—Population figures for the Prairie Provinces classified by rural and urban show that a definite trend towards urbanization has taken place since 1936. There has been an actual decline in the rural population of Manitoba and Alberta since 1941, and in that of Saskatchewan since 1936. This movement is partly a development of the Second World War.

In the 1946 Census, the practice of classifying the urban communities by size groups was continued and the rural population was separated into farm and non-farm portions. This latter distinction was considered advisable since much of the rural non-farm population is essentially urban in character, including as it does the

1941

unincorporated fringe areas of the larger cities. Table 21 shows the percentages of the total population living on farms, in rural non-farm areas, and in the urban centres according to specified size groups.

Urban centres of the Prairie Provinces with populations of over 30,000 at the Census of 1946 are shown in Table 4 at p. 144, and those with populations of 1,000 to 30,000 in Table 5 at pp. 148-149.

Movement of Population.—In order to measure the movement of population, persons enumerated at the 1946 Census of the Prairie Provinces were asked to state their place of residence five years previously, that is, on June 1, 1941. The answers were classified as same home, same municipality, same province, other Canadian province (specified), other country (specified). All but the first two of these categories were considered to represent the migrant population. The migrants, with the exception of those who came from other countries, were asked in addition to state the type of locality in which they had lived five years ago, that is, farm, rural non-farm, urban over 30,000, etc. A basis was therefore provided for measuring the population movements (a) by geographic regions, and (b) by type of locality.

Two major limitations to this method of studying migration should be pointed out. First, although this method is suitable for measuring the inward movements of population, the outward flow of population to other provinces and other countries cannot be measured directly. This limitation would not be so serious in a country-wide census. Secondly, the migration figures thus obtained refer to two specific dates, viz., June 1, 1941, and June 1, 1946. A person may have moved several times between those dates, but such movements would not be recorded.

In spite of these limitations, this study of migration undertaken at the 1946 Census has yielded some valuable results. It has shown for instance that there was a general trend away from the farms to urban and rural non-farm areas between 1941 and 1946. The relatively large increase in the rural non-farm population suggests a tendency towards the growth of unincorporated satellite communities

bordering the larger urban centres. It has shown also that approximately one-fifth of the population of the Prairie Provinces five years of age or over on June 1, 1946, were residing in a city, town, village or rural municipality different from that in which they were residing on June 1, 1941. Of this number, 76.6 p.c. had moved within the province, 21.1 p.c. had migrated from another province, and the remaining 2.3 p.c. were immigrants to Canada. The latter were predominantly of the female sex and from the British Isles, a high proportion no doubt representing British wives of returned Canadian service men.

Table 22 shows the different categories of non-migrants and migrants according to the type of locality in which they resided in 1946, while Table 23 provides a summary of the net movement of population to or away from farm areas, rural non-farm areas, and the different sized urban groups between June 1, 1941 and June 1, 1946.

Age Distribution.—A comparison of Table 24 with corresponding tables based on earlier censuses reveals that the proportion of the population in the older age groups has increased while the proportion in the younger age groups has decreased. This applies to all three provinces as the following percentages indicate. Population under 25 years of age in Manitoba declined from 51.4 p.c. of the total in 1931 to 44.0 p.c. in 1946; in Saskatchewan from 55.3 p.c. to 47.7 p.c.; and in Alberta from 51.7 p.c. to 46.3 p.c. Population 65 years of age or over in Manitoba increased from 4.5 p.c. of the total in 1931 to 7.3 p.c. in 1946; in Saskatchewan from 3.3 p.c. to 6.5 p.c.; and in Alberta from 3.5 p.c. to 6.3 p.c.

Marital Status.—An analysis of the 1936, 1941 and 1946 Census figures of population 15 years of age or over reveals that the ratio of ever-married persons (including widowed and divorced) to single persons has increased steadily in each of the three Prairie Provinces. The proportion rose from about 60 p.c. of the total population in 1936 to approximately 67 p.c. in 1946. This increase is no doubt partly explained by the rise in the number of marriages during the war years, while the sharp decline in immigration since the 1931 Census was also a contributing factor.

¹ Includes married couples living apart for domestic or economic reasons.

Birthplaces.—Of the 2,362,941 people residing in the Prairie Provinces on June 1, 1946, 1,446,487 or 61 p.c. were living in the province of their birth, 6 p.c. were born in other western provinces, 8 p.c. were born in the provinces of Eastern Canada, 9 p.c. were born in other parts of the British Empire, 5 p.c. were born in the United States, and 11 p.c. were born in other foreign countries. A comparison with the 1936 Census figures shows that the percentage of the population born in the province of residence and in other western provinces increased during the decade, while there was a significant decrease in the percentages born in Eastern Canada, in other parts of the British Empire, in the United States and in other foreign countries.

In recording European birthplaces, enumerators were instructed to be guided by the boundary divisions that were in existence in 1936.

Citizenship.—A total of 2,314,715 residents of the Prairie Provinces were recorded at the 1946 Census as British subjects. With the exception of a few hundred British subjects who had not acquired Canadian domicile, this represents the number of Canadian citizens under the terms of the Canadian Citizenship Act, assented to June 27, 1946. Of the 47,912 persons comprising the alien population on June 1, 1946, the majority owed allegiance to the United States, Poland, the U.S.S.R., and China in that order. A comparison of the figures of Table 27 with the figures of Table 26 indicates that a great majority of the foreign-born residents of the Prairie Provinces have now become citizens of this country.

¹ With the exception of a few hundred British subjects who had not acquired Canadian domicile, these figures represent the population having Canadian citizenship under the terms of the Canadian Citizenship Act, assented to June 27, 1946.

² Includes stateless persons.

Mother Tongues.—Table 28 shows that the English language was the mother tongue of 64.2 p.c. of the population of the Prairie Provinces at the time of the 1946 Census. Persons reporting French, the other official language of Canada, as their mother tongue, comprised 4.9 p.c. of the population.

By mother tongue is meant the language first spoken in childhood, if still understood by the person; for infants it is taken to be the language commonly spoken in the home.

There was a marked decrease in the numbers reporting a foreign mother tongue between 1936 and 1946. The one significant exception was Netherlandish, which showed a pronounced increase, especially in Manitoba. These statistics should be interpreted with some reserve, however, owing to the apparent tendency during and immediately after the War for people of German origin to report Netherlandish rather than German as their mother tongue.

Years of Schooling.—Table 29 presents information on years of schooling for the population of the Prairie Provinces according to the Census of 1946. Since this includes children attending school as well as persons no longer of school age, such information is of no great value unless it is classified by age. For that reason the schooling data in this table are presented for three broad age groupings, the last of which gives a good indication of the schooling attained by the adult population.

Years of schooling is probably the best available yard-stick for measuring educational attainment which is defined as the total number of school years a person attended any kind of educational institution. Persons attending night school or other part-time school, or receiving private tuition, were credited with the number of academic years equivalent to the work done. For children still at school the current school year was counted.

PART III.—INTERNATIONAL STATISTICS OF POPULATION

Section 1.—Area and Population of the British Empire

Statistics showing official estimates of the area and population of the British Empire by continents and countries are given in Table 52, pp. 141-142 of the 1943-44 Year Book.

Section 2.—Area and Population of the World

Statistics showing the areas and the populations of the various continents and details of each country, as in 1931, are given in a table at pp. 168-169 of the 1934-35 Year Book. The lack of statistical data and the dislocations caused by the War preclude the compilation of later information.

Section 1.—Immigration

General Summary of Immigration

In Canada, as in other young countries which have proved attractive to the immigrant, early immigration showed a recurrence of periods of very rapid growth, usually connected with certain important events in history, e.g.; Royal Government (1663), the American Revolution (1776), the Constitution Act (1791), building and development of Canadian railways (1880-1886) and the opening up of the Canadian West (1896-1911). These events all brought immigrants in substantial numbers to Canada in a period when the movement was unrestricted. Wars and periods of economic depression on the other hand have interfered with these movements.

Canadian immigration in its earliest days was confined, for the most part, to the French and British races. The French settlers, 28 in number, who wintered at the site of Quebec in 1608, were the beginnings of a French immigration movement that extended over the next 50 years and was largely associated with the monopolistic trading companies but by 1661 the population had increased to a mere 2,400 persons. After 1663, however, when King Louis XIV took over the colonization of New France, soldiers sent to protect the settlement from the Indians remained as settlers. They were followed by a systematic immigration of 'brides' and this assured the stability of the Canadian family. By 1701, the population numbered 17,000.

British immigration was very small until the American Revolution, when the movement of United Empire Loyalists at the outbreak of the Revolution established several permanent English-speaking settlements. With the Constitution Act of 1791 dividing Quebec into Upper and Lower Canada, interest in British immigration was increased and, from 1827 to 1832, 170,677 British immigrants arrived. Two-thirds of these were from Ireland, the remainder from England and Scotland: they settled in Upper Canada which then became more populous than Lower Canada.

Within the decade 1851-61, 216,000 immigrants arrived. Toward the latter part of that century the discovery of coal and gold in British Columbia, development of railroads and canals and opening up of the Northwest as with the extension of the boundaries of the Province of Manitoba brought many Continental Europeans and the first Oriental immigrants to Canada. Total immigration during the period 1861-91 amounted to 1,407,000.

* Revised under the direction of A. L. Joliffe, Director of Immigration, Department of Mines and Resources.

However, commercial depression and other influences between 1897-1900 reduced immigration and caused a large counter-migration to the United States, including for the first time, many emigrants of French origin. Immigrant arrivals between 1891 and 1900 numbered only 257,000.

The opening up of the wheat-producing prairies at the beginning of the twentieth century brought about the most spectacular immigration period in Canadian history, resulting in an increase of population between 1901 and 1911 of 1,847,651, with a steady continuing increase until an all-time high for any single year was reached in 1913 with 400,870 arrivals. After the outbreak of war in 1914, immigration declined. The highest figure recorded between 1913 and 1947 was in 1928 when immigrants numbered 166,783. During the depression from 1930 to 1939, immigrant arrivals were below 20,000 per annum. The War of 1939-45 again brought immigration almost to a standstill, less than 50,000 arrivals entering between 1940 and 1944. The wives and children of Canadian Service men made up most of the immigration during 1945-46, other arrivals numbering only 11,545.

Post-War Immigration Policy.—Immigration to Canada, which is based primarily on the Immigration Act of 1910 as revised in 1927, was, by Order in Council 695, dated Mar. 31, 1931, prohibited, with the exception of a few classes of immigrants. Since 1937, however, there have been a series of Orders passed which have widened the admissible classes to Canada. At the end of the Second World War the Regulations were further broadened to facilitate this end.

The policy of the Government is to foster the growth of the population of Canada by the systematic encouragement of immigration. At present (May, 1948) a Canadian citizen or Canadian resident, may bring to Canada any of the following categories of relatives:—

- (1) Husband or wife.
- (2) Father or mother.
- (3) Son, daughter, brother or sister, together with husband or wife and unmarried children if any.
- (4) Orphan nephew or niece, under 21 years of age.

In addition to the relatives mentioned above, agriculturists intending to farm, miners and woods-workers proceeding to assured employment in such industries, fiancés and fiancées of Canadian residents, are also among the admissible classes.

To provide for the necessary servicing of the immigrants, emigration offices are now in operation at London, Glasgow, Paris, Brussels, Rome, The Hague and Hong Kong. In addition, special immigration facilities are available in the Canadian Missions at Prague, Athens, Berne, Warsaw, Stockholm, Oslo, Copenhagen, Moscow, Lisbon, Mexico City, Buenos Aires, Rio de Janeiro and Santiago as well as at the High Commissioner's Office in the various Dominions.

Transportation for immigration purposes was at a premium during the whole of 1947. Up to the beginning of December, 1947, there were only two regular passenger vessels in the Canadian Service on which berths for immigrants could be obtained. In December, another vessel entered the North Atlantic Service and a fourth in February, 1948.

The most notable development in Canada's immigration policy during 1947, was the admission of the first displaced persons (D.P.'s.) from the refugee camps in Europe. Three United States transports, under charter, are used for the transportation to Canada of these refugees and displaced persons under the care of the International Refugee Organization. The program consisted of two main parts, the Close Relatives Plan and the Group Movement Plan.

Under the Close Relatives Plan special efforts have been made to facilitate the entry of relatives of Canadians whether the former be displaced persons or not.

In co-operation with the International Refugee Organization and other special groups actively engaged in the refugee problem, the relatives for whom application has been made in Canada are sought out, presented to the Immigration Officers for servicing, and transported as quickly as possible to Canada. Up to Mar. 15, 1948, there had been 27,890 applications made for relatives of which 21,743 were approved, resulting in 4,473 arrivals in Canada.

Persons coming under the Group Movement Plan are generally outside the ordinary immigrant categories and are dealt with by special Orders in Council. Three such orders have been passed, P.C. 2180 of June 6, 1947, provided for the admittance of 5,000 persons; P.C. 2856 of July 12, 1947, for another 5,000 persons and P.C. 3926 of Oct. 1, 1947, for an additional 10,000 making a total of 20,000 persons.

Under this Plan immigrants, in place of being nominated individually by Canadian residents, are selected in accordance with the recognized manpower needs of Canadian industry, by Canadian Immigration-Labour Teams, travelling in Europe. Six such travelling Teams, 4 in Germany and 2 in Austria, with headquarters at Karlsruhe, are now operating in the D.P. camps selecting immigrants on the basis of skills and aptitudes. Over 18,000 workers had been approved under the plan by Mar. 15, 1948, and 8,490 persons had arrived in Canada. Of these arrivals 3,599 went to lumber companies, 535 were employed in construction work for the railways and hydro-electric projects, 200 went to textile mills, 200 are employed in foundry and steel works, 778 were miners, 1,671 were assigned to domestic duties in hospitals, service institutions and private homes and 641, who brought 459 dependents with them, were employed in the garment industry.

Special approval was also given for the admission of 2,000 Jewish orphans from the camps in Europe and as of Mar. 15, 1948, 400 of these orphans had arrived in Canada.

During 1947, 4,527 Polish ex-servicemen were admitted to Canada to furnish immediate relief to farmers urgently requiring help. At the end of two years' employment at prevailing rates, consideration will be given to granting them permanent admission.

Approximately 3,000 Dutch agriculturists, consisting of both married and single persons, have been admitted to Canada and plans are under way for the admittance of an additional 10,000 during 1948.

Special mention must be made of the Ontario Government's Plan which was responsible for bringing, by specially arranged air transport, approximately 7,000 British immigrants to live in the Province of Ontario. This Plan was suspended in the spring of 1948.

As a direct result of the Federal Government's immigration policy, a total of 64,127 immigrants entered Canada in 1947. This figure is a 182 p.c. increase over the 22,722 immigrants who entered Canada during 1945 but was a slight decrease from the 1946 total of 71,719.

In April, 1948, the Acting Minister of Mines and Resources announced that arrangements had been completed for the biggest air migration in history. Trans-Canada Air Lines is to fly 10,000 Britons, 40 at a time, to Canada by Mar. 31, 1949. The arrangement with T.C.A., combined with increasing ship facilities that will

become available, will ease the serious shortage of immigrant transportation. The arrangement was the culmination of large-scale immigration plans that had been in progress for many months.

It was also announced that the number of D.P.'s to be admitted to Canada would be increased from the 20,000, authorized in the autumn of 1947, to 30,000.

Full information regarding the immigration regulations may be obtained from the Immigration Branch, Department of Mines and Resources, Ottawa. (See also p. 110 of the 1941 Year Book.)

Subsection 1.—Immigration Statistics

The following Tables 1 and 2 give a picture of immigration to Canada from 1894 to 1947. For more recent years, analyses are presented by sex, age, birthplace, racial origin, nationality, destination and occupation in Tables 4 to 9. Tables 12 and 13 deal with Canadians returning from the United States and Newfoundland and Table 14 shows oriental immigration.

Sex, Age and Marital Status.—In 1947, for the first time since 1941, male immigrant arrivals in Canada numbered more than females. In 1946, females constituted 71 p.c. of total immigrant arrivals for that year; in 1947, the distribution was more even, male arrivals being 52 p.c., and females 48 p.c. Adult male arrivals showed an increase of 17,347 over the 1946 figure while female adults decreased by 16,031.

In 1946, over twice as many or 66 p.c. single males arrived in Canada as married males, but in 1947 the rate was 56 p.c. married and 41 p.c. single. Of total females in 1946, 71 p.c. were married and 25 p.c. were single; the percentages for married and single females in 1947 were 43 p.c. and 46 p.c., respectively.

In 1946, children under 18 years numbered 20,967 of total immigrants and 93 p.c. were under 15 years of age. Immigrant arrivals under 18 years in 1947 numbered 12,059 of total immigrants and of these 83 p.c. were under 15 years of age. These figures show that adult immigrants in the two years mentioned represented 71 p.c. and 81 p.c., respectively, of the total.

Birthplace of Immigrants.—The figures of Table 6 show that about 95 p.c. of total immigrant arrivals in Canada during 1942-1945 were British or United States born.

British born, mainly born in England, Scotland and Newfoundland showed an increase from 1942 to 1946 of 45 p.c. to 78 p.c. during these years; United States born, however, showed a steady decline, during the same period, from 49 p.c. in 1942 to 13 p.c. in 1946. The percentage of Continental European born which had been negligible during the years 1942-45, almost doubled in 1946 from 4.5 p.c. to

8.7 p.c. and by 1947 arrivals showed a greater percentage than United States born; the figures in 1947 were: Continental European born arrivals 24 p.c., United States born, 11 p.c., and British born 65 p.c. Of other foreign born, China with 137 arrivals showed the largest number from any other country.

Racial Origins of Immigrants.—In 1947, over 44,083 or 69 p.c. of the immigrant arrivals were of British stock; 47 p.c. of these were English, 14 p.c. Scottish, 6 p.c. Irish and 2 p.c. Welsh. From the remainder of Europe the bulk of immigration has come, as formerly, from countries whose races are either ethnically close to the British stock or are assimilable with the basic races of Canada; this is

* In 1908 the fiscal year was changed to calendar year.

seen in the immigration of 3,499 Netherlands, 2,735 Polish, 2,424 Jewish, 1,523 French and 1,186 of German origin. These origins have long been the main races emigrating to Canada although, in later years, there has been an increasing immigration of Slavs. In 1947, the latter group was represented by 2,081 Ruthenians, 1,295 Lithuanians and 293 Russians. Oriental immigration and non-European immigration in 1947 accounted for only 452 immigrants; of these Negroes numbered 197.

7.—Racial Origins of Immigrants into Canada, 1943-47

NOTE.—Dashes in this table indicate that no immigrants were reported for the corresponding stub items. Figures for 1926-42 will be found in the corresponding table of previous Year Books beginning with the 1939 edition.

Intended Destination and Occupation.—Past experience shows that not all immigrants reach the province of intended destination. Of the total male immigrants 84 p.c. were classed as skilled workers, of the females about 15 p.c. of the arrivals were skilled workers and approximately 40 p.c. were wives. (See Table 9.)

Farm and clerical workers accounted for 38 p.c. of the total number of skilled workers. Unskilled labour for operations in the woods accounted for 45 p.c. of the unskilled immigrants arriving in 1947.

Rejections and Deportations.—The Immigration Act provides for the rejection and deportation of immigrants belonging to prohibited classes, and also for the deportation of those who become undesirables within five years after legal entry.

The results of the operation of the above regulations are shown in Tables 10 and 11, p. 182, which give the numbers of immigrants rejected on arrival and those deported after admission, the causes of such rejection or deportation, and the nationality of those deported for the years 1937-1947.

In 1947, of the 369 immigrants rejected, 205 were of British nationality, 20 French, 16 Spanish, 9 Greek and the remainder owed their allegiance to 34 other countries.

Subsection 2.—Returning Canadians

Since 1924, immigration officers have recorded the number of Canadians returning to Canada from the United States after having left Canada to reside in that country. Statistics of that movement are given in Table 12.

12.—Canadians¹ Returned from the United States, 1926-47

¹ Not including aliens with Canadian domicile.

Statistics of the permanent migration between Canada and the United Kingdom published by the British Board of Trade are given at p. 169 of the 1942 Year Book

Commencing Apr. 1, 1938, enumeration was made of returning Canadians and other non-immigrants entering the Dominion from Newfoundland.

13.—Returning Canadians and Other Non-Immigrants Entering Canada from Newfoundland, 1945-47

Totals.....	23,043	24,173	22,329

Subsection 3.—Juvenile Immigration

Juvenile immigration, apart from children accompanying their parents, has not been a large factor since 1931, when the Federal Government ceased to grant financial assistance for this particular form of immigration. There were 33 juvenile immigrants in 1941, 23 in 1942, 28 in 1946, 6 in 1947 and 28 in 1948.* An outline of juvenile immigration, including those children brought to Canada under the British Empire Settlement Agreement, is given at p. 121 of the 1941 Year Book.

Subsection 4.—Oriental Immigration

Under wartime conditions, Oriental immigration ceased to be a problem and the economic effect of the presence of persons of Oriental origin can best be studied from census figures. The Chinese Immigration Act was repealed on May 14, 1947. Chinese immigration has been controlled under the Immigration Act subsequent to that date. An outline of the background and legislation connected with the immigration of Orientals into Canada is given at pp. 122-124 of the 1941 edition of the Year Book, and Table 14, below, presents statistics of Oriental immigration since 1906, the earliest year for which figures are available. These figures are given by sex at pp. 175-176 of the 1945 Year Book.

*See p. 174 for orphans arriving by special permission during 1948.

Section 2.—Emigration

Emigration from Canada is an important factor tending to offset the immigration activities of the past and has attained considerable proportions at certain periods. The two main factors have been the migration to the United States of Europeans originally immigrating to Canada and the emigration of native-born Canadians.

A question of considerable interest to Canadians is that of the permanent movement of population between Canada and the United States. In view of the lack of Canadian statistics on emigration, Table 15 has been compiled from figures supplied by the Immigration and Naturalization Service of the United States Department of Justice. Not all of the statistics are available by months, so that it has not been possible to present the figures on a calendar-year basis; they are, therefore, shown on that of the United States fiscal year, July 1-June 30. The column headed "Deportable Aliens Destined to Canada" covers persons permitted to return to Canada in lieu of deportation proceedings.

Section 1.—Historical Sketch of the Collection of Vital Statistics in Canada

The collection of vital statistics began in Canada, as in England, with the registration of baptisms, marriages, and burials by the ecclesiastical authorities. These registers, maintained by the priests from the first settlement of the country, have made it possible for the vital statistics of the French colony to be compiled from the year 1610†. The system of registration by the Roman Catholic clergy was continued after the cession of the country to the British, and was extended to the newly-formed Protestant congregations of Lower Canada by an Act of 1795, but the registration, particularly of births, among these latter remained seriously defective, both in Lower Canada and in the new Province of Upper Canada, the pioneers often settling far from the authority of government and the ministrations of religion.

In English-speaking Canada, the earlier scheme of registration of baptisms, burials, and marriages by the clergy was later succeeded by Acts for the enforcement of registration of births, marriages, and deaths with the civil authorities. Such Acts were passed in Nova Scotia in 1864, Ontario in 1869, British Columbia in 1872, Manitoba in 1881, New Brunswick in 1887, and Prince Edward Island in 1906. The Provinces of Saskatchewan and Alberta were not established until 1905 and, until provincial Acts were passed after this date, civil registration in these Provinces was governed by ordinances for the Northwest Territories, the first of which was passed in 1888. Registration, particularly of births, was at first very defective in the various provinces.

Prior to 1920 it was impossible to compile satisfactory series of vital statistics figures for Canada as a whole. Obstacles to such a national compilation were: variations in the Vital Statistics legislation as between provinces, incompleteness of registration, lack of uniformity in classification and method of presentation, omission of important data, choice of the fiscal instead of the calendar year as the time unit, and the fact that, for some of the provinces within comparatively recent years, the series of publications is incomplete. In New Brunswick no vital statistics were published from 1895 until 1920.

* This Chapter has been revised by J. T. Marshall, Acting Director, Vital Statistics Division, Dominion Bureau of Statistics.

† For a summary of the vital statistics of the Roman Catholic population from 1610 to 1883, see the Statistical Year Book of Quebec, 1921, English or French edition, p. 51. For details, by years, of this movement of population, see Vol. V of the Census of Canada, 1871, pp. 160-265, and Vol. IV of the Census of Canada, 1881, pp. 134-145.

Two attempts were made in the past to remedy this situation. In the year 1882 the Federal Government instituted a plan for recording annually the mortuary statistics of cities of 25,000 and over, by subsidizing local boards of health to supply the necessary information under special regulations. By 1891, twenty-five cities were included in this plan. With the organization of provincial records, the work of the Federal Government in this connection was abandoned.

The other attempt to meet the situation was through the medium of the Census. In the earlier censuses of the Dominion questions were included in the schedules requiring the number of births and the number and causes of deaths occurring during the preceding year. This method was followed until 1911 when the obviously unreliable character of the results led to the elimination of the questions from the census schedules.

As provided under the Statistics Act of 1918, which established the Dominion Bureau of Statistics, and as the result of two Dominion-Provincial Conferences on vital statistics held at Ottawa, in June and December, 1918, a plan was devised whereby the Dominion Bureau of Statistics and the Vital Statistics offices in each province would co-operate in the production of national vital statistics. Under this national system, while registration of births, stillbirths, marriages and deaths was to be carried out as heretofore by the provincial authorities, the legislation of each province conformed in essential features to a Model Vital Statistics Act—one of the features of which was compulsory registration—adopted by the 1918 Conferences.

An essential part of this scheme of co-operation was that the registration of births, deaths, and marriages be made on standard registration forms to be supplied to the provinces by the Dominion Bureau of Statistics. Copies of the completed forms were to be forwarded to the Dominion Bureau of Statistics. From these were compiled the national statistics and the main tabulations required by the provinces for insertion in the Annual Reports made to their respective Legislatures, thus ensuring uniformity in the treatment of the material. The operation of the arrangement did not in any way prevent provinces or cities from making such additional compilations as they might desire.

On Jan. 1, 1920, eight provinces entered into the co-operative system for the production of national vital statistics. A summary report covering these eight provinces was issued for that year but the first detailed report published by the Dominion Bureau of Statistics was for the year 1921. For reasons connected with its system of registration, Quebec, the oldest province in Canada, found it impossible to enter into the national system at the time it was established. Later the difficulties were overcome and this Province entered the Registration Area from the beginning of the year 1926.

Through the close co-operation of the Provincial Registration Offices and the Dominion Bureau of Statistics, very material progress was made subsequent to the initiation of the national system in modifying and improving registration techniques and procedures. Of particular interest in this regard was the revision in 1935 of the medical certificate of death which is an integral part of the death registration form. There has always been one main objective in the collaborative effort of these early years of the national system—the complete and accurate registration of all 'vital' events in Canada, which in turn is reflected in the availability of more complete and accurate vital statistics data.

Conferences on vital statistics, held in 1943 and 1944, were attended by provincial and Federal officials, by representatives of departments of government, and other interested national agencies. Topics discussed at these conferences

covered such widely diversified problems as: registration affecting Indians, inter-provincial exchange of vital records, establishment of standards for delayed registration of birth, definition of vital statistics terms, standards of certification, divorce and adoption records, preliminary study of uniform provincial Marriage Acts—to name but a few.

At the Dominion-Provincial Vital Statistics Conference of 1944 the implications, for vital statistics, of impending social security legislation were studied. The immediate objective of this Conference was the formulation of an arrangement for a relatively speedy, accurate and efficient method of verification of the facts of birth of all children under the age of 16 in Canada. It was imperative that this procedure be accomplished: (a) within the provisions of the provincial vital statistics legislation; (b) without disrupting the normal operation of the Provincial Registration Offices, and (c) with the maximum of speed. This verification process was required in connection with the implementation, on July 1, 1945, of a national scheme of Family Allowances whereby the Federal Government was to pay a monthly allowance on behalf of each child.

The plan recommended by this Conference was approved by individual agreement between the Dominion and the Provinces and provided, among other terms:

- (a) that in lieu of transcript copies as heretofore, of all births, stillbirths, marriages and deaths, the Provincial Registration Offices would transmit, currently, to the Dominion Bureau of Statistics, microfilms of the original registrations as well as microfilm copies of all births registered in the Provincial Registration Offices since Jan. 1, 1925;
- (b) for the processing, by the Bureau of Statistics, of Hollerith punch cards from these records and the preparation of indexes for governmental and other purposes approved by the provinces;
- (c) for the production as heretofore, of national tabulations on vital statistics for the use of the provinces and other agencies;
- (d) for the production of an index, showing the births of children in each province and each year of birth and covering all persons born in Canada since Jan. 1, 1925.

Although the National Index is now being used as a posting medium for Family Allowance purposes, its use may be extended to meet other needs, as they may arise, and as approved by the provinces on the recommendation of the Vital Statistics Council for Canada.

The agreement arising out of the Conference of 1944 went into effect on July 1, 1945.

The Order in Council ratifying this Dominion-Provincial Agreement also provided for the establishment of a Vital Statistics Council made up of one representative from each of the Provincial Registration Offices and the Federal administration responsible for registration in Yukon and the Northwest Territories, the Dominion Statistician, as Chairman, and the Directors of the Vital Statistics and Census Divisions of the Bureau of Statistics.

This Council is a representative national body whose primary functions are:

- (a) to discuss problems of registration procedure and legislation;
- (b) to determine and advise their respective governments of such changes in registration techniques as appear useful or necessary;
- (c) to improve, as one of its main objectives, the statistical quality of vital statistics tabulations, and
- (d) to make recommendations as to the future use of the National Index.

In short, the Council has become the clearing-house for problems of registration, vital statistics and the National Index, and has been the means of increasing and consolidating that close co-operation between the provincial and national offices

of vital statistics, which has existed since the inauguration of the national system. Its constitution calls for at least one annual meeting and for more frequent meetings when required.

During recent years, the registration of vital events in the several provinces may be considered virtually complete. This is attributable in large measure, not only to the impetus of rationing requirements during the war years, and the implementation of national family allowances, but in addition to an increasing need for birth certification. It is, however, primarily the direct result of the unrelenting efforts to this end, over the years, of the Provincial Registration Offices.

By 1947, it became apparent that the Model Bill of 1918 no longer fully met present day requirements of an adequate registration system, and that the study of new uniform legislation was essential. Accordingly, at the request of several of the provinces, the Minister of Trade and Commerce called a Conference in 1947 at Ottawa for the specific purpose of studying the technical provisions of a new Model Vital Statistics Act.

This Conference was attended by officials in charge of the Provincial Registration Offices, the Legislative Councils of several provinces, and by representatives of national organizations. A final bill, which will incorporate the technical requirements, as laid down by this Conference, will be framed by the *Conference of Commissioners on Uniformity of Legislation in Canada* and will form the basis of any recommendation which may be made to the several Provincial Governments.

Classification of Vital Statistics.—Until recently, vital statistics were all classified by place of occurrence. In 1944, however, the classification of births and deaths by residence was begun; births being classified by the residence of the mother. A number of special tabulations by residence have been made for a few years before 1944; in Tables 1 to 4 the figures for 1941-46 are given by residence. In all other tables of this Chapter, figures for 1944 to 1946 are given by residence, except in Tables 5, 9, 10, 11 and 22. Headnotes of the tables throughout show the classification used.

For most provincial figures and rates, the change in classification makes comparatively little difference but, for individual localities, the differences may be quite large. In such cases, the figures for the years 1941 and after are not comparable with the five-year averages for the earlier years.

Section 2.—Summary of Vital Statistics

Tables 1 to 5 give a summary of the vital statistics of Canada and the provinces for the years 1926 to 1946.

In comparing the birth, death and marriage rates of the provinces, it is useful to bear in mind that part of the differences observed may be due to differences in the sex and age distribution of their populations. Similarly, changes in these rates may be due partly to changes in this distribution. These remarks also apply to international comparisons of birth, death and marriage rates. For example, in Canada the birth rate of Quebec is approximately the same as that of New Brunswick, and considerably higher than that of Prince Edward Island. Yet the fertility of the female population is highest in New Brunswick and approximately equal in the other two provinces. Over the past 15 years, the death rate in British Columbia has been rising, while in Ontario it has been more or less stable, with the result that, though 15 years ago the death rate in Ontario was considerably higher than in

British Columbia, at present their rates are about equal. This does not mean, however, that the mortality rates at each age have risen in British Columbia. On the contrary, they have been falling. The death rate for the population as a whole has been rising because the increasing proportion of population in the higher age groups has more than outweighed the fall in the mortality rates at each age.

Canadian Life Tables.—Life tables have been calculated on the basis of the population of 1941 and the deaths of 1940-42. These are the second official life tables for Canada to be published, the first having been calculated on the basis of the deaths of 1930-32 and the population of 1931. The life table for 1941 is given in abbreviated form in Table 6.

Life tables give a summary of the health and general conditions of survival of the population in a conventional, standard form. A hypothetical number (100,000) births of each sex is assumed. The life tables show how, on the basis of the mortality rates at each age in the given years, these 100,000 of each sex are reduced in number by death. Thus, for example, in 1940-42, of 100,000 males born, 6,250 died in their first year, so that 93,750 survived to one year of age; 676 died in their second year, so that 93,074 survived to two years of age; and so on. At 100 years of age, only 50 of the original 100,000 would have survived. The probability of death at each age is the ratio between the number of deaths and the population at each age. Finally, the expectation of life is the average number of years which a person might expect to live if the mortality rates in the given years remained constant.

Mortality rates for males are higher at all ages than for females, particularly in infancy. Infant mortality in 1940-42 was 62 per 1,000 live births for males compared to 49 per 1,000 for females. Because infant mortality is still so high, the expectation of life at birth is less for both sexes than at age 1. Males who have survived their first year have an expectation of life of 66 years and females of 69 years. The expectation of life of a boy at age 15 is 54 years, and of a girl 56 years. At age 25, it is 45 years for men and 47 for women. At age 70, when people become eligible for old age pensions, it is 10 years for men and 11 years for women. In 1930-32 mortality rates for females from 25 to 40 years of age were higher than those for males. In 1940-42, however, because of the reduction in maternal mortality, this was not so.

Section 3.—Births

International Comparisons.—A comparison of the birth rates in Canada and the provinces with those in other countries is shown in Table 7. For Germany, Italy and most countries that were occupied by the enemy, the figures are given for 1939. Later figures, even when available, cannot be considered reliable. This also applies to later tables showing international comparisons, i.e., Tables 20, 21 and 35.

¹ Trianon Territory.

² Adjusted.

In Canada, in 1921, the birth rate was 29.4 per 1,000. Since a rate of 35 per 1,000 is very high for countries of modern western civilization, the Canadian birth rate had probably not fallen far or for long before then. But it fell continuously until 1937, when it was 20.0 per 1,000. Since then, owing to economic recovery and the War it rose to 21.5 in 1940, to 24.0 in 1943 and to 26.9 in 1946. The birth rate in the provinces followed the same general trend, though in the Maritimes the fall stopped before 1930.

Sex of Live Births.—Wherever birth statistics have been collected, they have shown an excess of male over female births. No conclusive explanation of this excess has yet been given. Nevertheless it is so much of an accepted statistical fact that a proper ratio of male to female births has become one of the criteria of complete registration. The number of males to every 1,000 females born in Canada in 1941-46 has varied between 1,057 and 1,067.

Hospitalization and medical attendance at birth have increased in Canada. In 1926-30, only 22 p.c. of live births occurred in hospitals, while in 1940-42 the proportion was 49.5 p.c. and in 1946, 68 p.c. The provinces still differ greatly in this respect. In 1946 the proportions of births which occurred in hospitals were Quebec 36 p.c., New Brunswick 54 p.c., Nova Scotia 74 p.c., Ontario 85 p.c., Manitoba and Saskatchewan 87 p.c., Alberta 93 p.c., and British Columbia 95 p.c.

8.—Live Births by Sex, Birth Rates, and Ratio of Males to Females, by Provinces, 1944-46

NOTE.—Figures are by place of residence.

Births in Urban Centres.—Table 9 shows the number of live births in the urban centres of Canada with 10,000 population or over in 1941. The five-year averages for 1936-40 show births by place of occurrence. Many of these births were to women who lived elsewhere. The figures for 1944-46 are by the residence of the mother, and show the number of births, wherever occurring, to residents of each centre. The two sets of figures are thus not comparable.

9.—Live Births in Urban Centres of 10,000 Population or Over, 1944-46, with Five-Year Averages, 1936-45

NOTE.—Figures are by place of occurrence previous to 1941; for 1941 and subsequent years they are by place of residence.

Illegitimacy.—Less than 5 p.c. of live births in Canada are illegitimate. This percentage is comparatively low. The apparent increase since 1926 is partly due to the more complete registration of illegitimate births, brought about by the co-operation of provincial registration officials and social welfare agencies, and by their more sensible and sympathetic treatment of illegitimacy.

10.—Illegitimate Live Births, and Percentages of Total Live Births, by Provinces, 1944-46, with Five-Year Averages, 1926-45

NOTE.—Figures are by place of occurrence previous to 1941; for 1941 and subsequent years by place of residence.

Stillbirths.—Table 11 shows the number of stillbirths in Canada and the provinces, together with the rates per 1,000 live births. The rate of stillbirths has been falling since 1926, though not equally in all provinces. The rate of illegitimate stillbirths per 1,000 illegitimate live births is considerably higher than the rate of legitimate stillbirths, and consequently higher than the over-all rate.

11.—Stillbirths, and Rates per 1,000 Live Births, by Provinces, 1944-46 with Five-Year Averages, 1926-45

NOTE.—Figures are by place of occurrence previous to 1941; for 1941 and subsequent years by place of residence.

Multiple Births.—Approximately one confinement in 85 in Canada results in the birth of more than one child. In 1926-46, there have been 61,444 such confinements, of which 60,878 were twins and 559 were triplets. There have been six sets of quadruplets. The Dionne quintuplets were born in 1934.

Table 12 shows that the proportion of stillbirths is higher among multiple than among single births. It is about twice as high for twins and between two and six times as high for triplets.

Fertility Rates.—The sex and age distribution of the population is an important factor in determining birth, death and marriage rates. Since more than 95 p.c. of children are born to women between the ages of 15 and 50, differences in the proportion of women of these ages to the population as a whole will cause differences in the birth rates of different countries or regions, even though the fertility of women at each age may be the same. Measures of fertility which are independent of the sex and age distribution of the population have, therefore, been devised. The best known of these are age-specific fertility rates and reproduction rates.

Further details on this subject may be found at pp. 153-154 of the 1947 edition of the Year Book or from the report "Gross and Net Reproduction Rates, Canada and the Provinces," published by the Dominion Bureau of Statistics, Ottawa.

Age of Parents.—The numerical and percentage distribution of legitimate live births by the ages of the parents, is given in Table 13, of illegitimate live births by the age of the mother, in Table 14, and of stillbirths by the age of the mother in Table 15. The average ages of the parents are also given.

It will be seen that the average age of parents is now slightly lower than it was in 1930-32. Besides the fertility rates at each age, two other factors help to determine the average age of parents having children; first, the average age of potential parents, that is, of the population between the ages of 15 and 50 and secondly, the proportions of first and second births to the total. The average age of men between 15 and 50 was 30.9 years in 1931 and 30.7 in 1941; the average age of women was 30.4 in 1931 and again 30.4 in 1941. The changes are thus very small. Other things being equal, a high proportion of first and second births will result in a lower average age of parents. In 1930-32, first births were slightly less than one-quarter of all births, and second births less than one-fifth. First and second births thus were 43 p.c. of the total. In 1940-42, first births were over one-third of all births, and second births nearly one-quarter. First and second births together thus were 56 p.c. of the total. These changes are very great and account for the lower average age of parents.

A number of other facts are shown in Tables 13, 14 and 15. In the first place, the average age of fathers of legitimate children is about 4 years greater than the average age of mothers. Secondly, the average age of mothers of illegitimate children is about 5 years less than the average age of mothers of legitimate children; in 1930-32 the difference was 6 years. The fact that over two-thirds of illegitimate children are born to mothers under 25 years of age accounts for this difference. Thirdly, the average age of mothers of stillborn children is higher than that of live born. Table 15 shows that the rate of stillbirths per 1,000 live births increases with age of the mother. It is more than twice as high among mothers of 40-44 years as it is among mothers of 20-24, and over three times as high among mothers of 45-49.

Birthplace of Parents.—Table 18 shows the numbers and percentages of children whose parents were born in Canada or in different countries abroad. The proportion of children born to British-born and to foreign-born parents is decreasing. This is the result of the smaller immigration of recent years.

18.—Numbers and Percentages of Live Births by Nativity of Parents, 1944-46, with Five-Year Averages, 1936-45

¹ Less than one-tenth of one per cent.

² This figure gives the number of children whose fathers and mothers were born in the same country. The difference between this figure and the total number of births represents the number of children whose parents were born in different countries.

³ This is

the percentage of children whose fathers and mothers were born in the same country.

Origin of Parents.—Table 19 shows the numbers and percentages of children born to parents of the principal racial or ethnic groups in Canada. A person's origin is usually traced through the father. For example, if the father is English and the mother French, the person's origin is said to be English. Illegitimate children, however, are usually classified by the origin of their mother, since the origin of the father is seldom known.

Table 19 shows that about two-thirds of Canadian children are born to parents who are both of the same origin; one-third are born to parents of different origins. A certain amount of this inter-mixture has no doubt been going on for many years. It is clear that, in addition to biological factors, geography, language, religion and economic resources contribute to the formation of different ethnic or cultural groups.

19.—Numbers and Percentages of Live Births to Parents of Specified Origins, 1941-46, with Five-Year Averages, 1936-45

NOTE.—Figures for 1944 to 1946 are by place of residence; for previous years by place of occurrence.

Section 4.—Deaths

Except for wars and their after-effects—military and civilian deaths in the First and Second World Wars must be counted in tens of millions—impressive declines in the death rate have been recorded during the past century in many countries of the world.

Another way of measuring mortality is by life tables and the expectation of life that they show. Expectation of life in Canada in 1940-42 was 63.0 years for males and 66.3 years for females.

Subsection 1.—General Mortality

International Comparisons.—A comparison of the death rates in Canada and the provinces with those of other countries is shown in Table 20.

20.—Death Rates per 1,000 Population of Various Countries of the World Compared with Canada and the Provinces for Recent Years

¹ Trianon Territory.

The number of deaths in Canada fell steadily from 113,515 in 1929 to 101,582 in 1934. The high number of deaths in 1937 (113,824) and in 1943 (118,635) was partly due to higher mortality from influenza, bronchitis and pneumonia.

Since 1931, the Canadian death rate has fluctuated between 10.3 and 9.4 per 1,000. It has been more or less stable in Ontario, has been falling in the Maritimes and Quebec and has been rising slightly in the Prairie Provinces and British Columbia. The exceptionally low death rates in the Prairie Provinces are partly due to their younger average population but the apparent slow rise in the death rates of the Prairie Provinces and British Columbia, is due to the increasing proportion of people in the older age groups. In all parts of Canada, however, the 1941 life tables show that public health and general living conditions have improved.

Throughout Table 21, with one exception (Prince Edward Island death rates of 1945) the death rate is higher for males than for females.

Deaths in Urban Centres.—In Table 22 deaths are classified by place of residence, the death rate in urban centres varies only slightly from the death rate of their respective provinces. However, due to the influx of people from the rural areas, the age distribution of the population in urban centres is often more favourable to a low death rate than that of a province as a whole.

22.—Deaths in Urban Centres of 10,000 Population or Over, 1944-46, with Five-Year Averages, 1936-45

NOTE.—Figures are by place of occurrence previous to 1941; for 1941 and subsequent years by place of residence.

Sex and Age Distribution of Deaths.—Despite reductions in infant mortality, more deaths still occur in the first year of life than in any other year. The number of children who die under five years of age has been reduced from an average of 25,174 in 1930-32 to 17,949 in 1940-42. In 1946, owing to the exceptionally large number of births—15 p.c. over 1945—the number rose slightly to 18,334.

Table 23 shows that the percentage distribution of deaths has changed greatly since 1930-32. The percentages of deaths at all ages up to 50 years have declined, and the percentages at ages over 50 have increased. The average age at death has gradually risen. The reduction in mortality rates in the early and middle years of life increases the number of people in the older age groups and raises the average age of the population as a whole. In 1931, 16.6 p.c. of the population was 50 years of age or over. The average age of all males was 29.0 years and of all females 28.1 years. In 1941, 19.7 p.c. of the population was 50 years of age or over, and the average age of all males had risen to 30.7 years and of all females to 30.2 years. Compared to most European countries, however, the Canadian population is still young.

23.—Deaths, by Sex and Age Groups, 1945 and 1946, with Three-Year Averages, 1930-32 and 1940-42

NOTE.—Figures for 1945 and 1946 are by place of residence; for previous years by place of occurrence.

Causes of Death.—About 90 p.c. of the deaths in Canada are due to the 28 specified causes given in Table 24. About 75 p.c. are due to the 10 leading causes: diseases of the heart, cancer, intracranial lesions, violent deaths, nephritis, diseases of early infancy, pneumonia, tuberculosis, influenza and diseases of the arteries.

The classification of the causes of death is according to the revision of the International List of 1938, which was first used in Canada in 1941. Each revision of the International List makes continuity of classification difficult. This applies especially to diseases of the heart, intracranial lesions (cerebral hæmorrhage) and diseases of the arteries.

The rise in the average age at death has been noted on p. 207. Causes of death that affect mainly children and young adults have declined. Diphtheria, for example, has almost been wiped out. Tuberculosis has also been greatly reduced. On the other hand, the ageing of the population increases the proportion of deaths from the causes that affect mainly older people. Thus, cancer, nephritis and diseases of the heart now account for a substantially larger proportion of all deaths, than formerly.

¹ The numbers given in this column refer to the International List of Causes of Death, as revised in 1938 by the International Commission on the Classification of Diseases and Causes of Death. This classification, in its detailed, intermediate or abridged form, is accepted by almost all civilized countries.

Subsection 2.—Infant Mortality

The energy devoted in recent years to reducing infant mortality has brought about large reductions in many countries. In Canada, the Federal, provincial and municipal health authorities, together with private welfare agencies, have all taken part in the effort, with the result that the figures from 1926 to 1946, show a striking improvement. To illustrate, of the children born in 1942-46, approximately 60,000 lived to their first birthday who would have died at the rate prevailing in 1926-30.

Infant mortality of males is 25 to 30 p.c. higher than that of females. It was pointed out earlier that there were between 1,057 and 1,067 males born to every 1,000 females. Because male infant mortality is higher, the excess of males is much less at the end of the first year. For example, in 1940-42, 397,038 male children were born, compared with 374,908 female children, an excess of 22,130 or 5.9 p.c.; 25,024 male children died during their first year compared with 18,646 female children, that is 6,378 more. The excess of males at one year of age is thus 15,752, or 4.4 p.c. By the age of 52, according to the life table, p. 192, the number of males and females will have become equal.

Infant mortality figures and rates per 1,000 live births by sex are given for Canada and the provinces in Table 25. The rates vary considerably between the provinces. One of the principal causes of these variations appears to be the different proportions of births which take place in hospitals under proper medical care. Examples of these differences have been given earlier on p. 193. Along with this increased hospitalization has come better and more wide-spread pre-natal and post-natal care. Other factors, particularly the supervision of water supplies, improved sanitation and the pasteurization of milk have also been important. Further extension of public-health services to provide for all the population will, no doubt, further reduce infant mortality, particularly in the areas where it is still high.

International Comparisons.—New Zealand for many years has had the lowest rate of infant mortality. In 1946 the rate was 26 per 1,000 live births, compared with 68 in 1905, 51 in 1920 and 34 in 1930. Sweden, Iceland and

Australia also have very low rates. In England and Wales the rate has been reduced from 128 per 1,000 in 1905 to 60 in 1930 and 43 in 1946. In the United States the rate has been reduced from 162 in 1900 to 47 in 1940 and 34 in 1946.

Infant Mortality in Urban Centres.—Infant mortality rates in individual cities and towns usually vary widely from year to year. Many cities and towns have, however, maintained consistently low rates. Vancouver has a splendid record; Calgary, Toronto and Winnipeg have exceptionally low rates and Montreal has shown steady improvement.

Infant Mortality by Causes of Death.—Of the infant deaths that occur in Canada, about 90 p.c. are due to the nine causes and groups of causes specified in Table 28. One cause, premature birth, accounts for over 20 p.c. The rates from nearly all causes are higher for male than for female children; the only exception shown in the table is for communicable diseases in 1944.

28.—Infant Mortality and Rates per 100,000 Live Births, by Principal Causes, 1944-46

NOTE.—Figures are by place of residence.

¹ Includes measles, scarlet fever, whooping cough, diphtheria, influenza, erysipelas, acute poliomyelitis and polioencephalitis, cerebrospinal meningitis, tuberculosis and syphilis.

Subsection 3.—Maternal Mortality

As in the case of infant mortality, the number of mothers who die in pregnancy and childbirth has been greatly reduced. Maternal mortality in Canada and the provinces is shown in Table 29. Although the number of births has been much greater in recent years, the number of maternal deaths has been well below a thousand

a year. The rate of maternal mortality is now less than 2 per 1,000 live births. The last two columns of the table show that mortality among unmarried mothers is much higher than among married mothers.

29.—Maternal Deaths and Rates per 1,000 Live Births, by Provinces, 1944-46

NOTE.—Figures are by place of residence.

¹ Exclusive of the Territories.

Age at Maternal Death.—Table 30 shows the distribution of maternal deaths by age, together with the average age at death. The latter is slightly more than two years higher than the average age of all mothers at the time of childbirth. The rates per 1,000 live births by age groups show that age is a most important factor in maternal mortality. Though all the rates are much lower than they used to be, the inequalities between the age groups remain. The rate at 30-34 years is nearly twice as high as the rate at 20-24 years, and above the age of 40 it is over four times as high. The slightly higher rate in the first age group shown in Table 30, compared with the second, is due to the high proportion of illegitimate children born to young mothers.

30.—Maternal Mortality and Rates per 1,000 Live Births, by Age Groups, 1945 and 1946, with Three-Year Averages, 1930-32 and 1940-42

¹ The number of cases in this age group is too small to justify the calculation of a rate.

Maternal Deaths by Causes.—Table 31 shows, by causes, the numbers and rates of maternal deaths per 100,000 live births. Until recently, puerperal sepsis and toxæmias of pregnancy were by far the most important causes. Since the introduction of sulpha drugs in 1936, the rates from these two causes have decreased by 50 p.c.

31.—Maternal Mortality and Rates per 100,000 Live Births, by Causes of Death, 1944-46

NOTE.—Figures are by place of residence.

Section 5.—Natural Increase

In 1926-30 the rate of natural increase in Canada was 13 per 1,000 population. It fell to 9.7 in 1937. Owing partly to the depression, the birth rate declined more than the death rate. Since then, the rate has increased to 12.6 in 1940-42, 14.5 in 1945 and 17.5 in 1946.

The rates of natural increase in the provinces followed generally the rate for Canada as a whole. In the earlier years, Saskatchewan and Quebec had the highest rates. The high rates in the Prairie Provinces were due partly to their relatively younger populations and consequent very low death rates. In Quebec, on the other hand, the death rate in 1926-30 was high; it has declined steadily since. In 1946, New Brunswick had the highest rate of natural increase in Canada.

Table 32 shows the numbers and rates of natural increase in Canada and the provinces. Numbers and rates by sex are also shown. It can be seen that in almost all cases, the rates are higher for females than for males. There are two reasons for this. First, the excess of male over female births is relatively smaller than the excess of males over females in the population as a whole, especially in the western provinces. Hence the birth rate for males is lower than the birth rate for females. Secondly, as already noted, the death rate for males is higher than for females.

In a country with a fairly young population such as Canada, in which immigration has been large, an excess of males is to be expected. The higher rate of natural increase for females is the means by which this excess is gradually reduced. Eventually, there will, no doubt, be an excess of females in the total population as there now is in most European countries.

32.—Natural Increase and Rates of Natural Increase, by Sex and by Provinces, 1944-46

Natural Increase in Urban Centres.—The classification of births and deaths by place of residence makes it possible to calculate rates of natural increase for urban centres; the figures are given in Table 33. In most of the larger cities, the rate is lower than in their respective provinces. Urban population is also increased by the influx of people from the rural areas.

33.—Natural Increase in Urban Centres of 10,000 Population or Over, 1944-46, with Five-Year Averages, 1936-45

NOTE.—Figures are by place of occurrence previous to 1941; for 1941 and subsequent years by place of residence.

Section 6.—Marriages and Divorces

Subsection 1.—Marriages

International Comparisons.—Table 34 shows the marriage rates in Canada and the provinces in comparison with those of other countries. Canadian marriage rates are relatively high.

34.—Marriage Rates per 1,000 Population of Various Countries of the World Compared with Canada and the Provinces for Recent Years

(Sources: Monthly Bulletin of Statistics of the United Nations and other official sources. In certain cases final figures are not available and provisional data are shown.)

¹ Trianon territory.

In modern industrial countries, the marriage rate varies with the level of economic prosperity. Marriage rates fell during the depression years following 1929, but recovered in the later 1930's. In Canada, England and the United States, the number of marriages was exceptionally high in 1940-42. The number decreased in the years 1943 and 1944 but increased in 1945 and 1946. In Canada there were 20 p.c. fewer marriages in 1944 than in 1942. In 1945 there were 7 p.c. more marriages than in 1944 and in 1946 the number was 5.3 p.c. more than in 1942, the previous high year.

Numbers and Birthplaces of Brides and Bridegrooms.—Table 35 shows the number of marriages and the marriage rates per 1,000 population in Canada and the provinces. Percentages of brides and bridegrooms according to place of birth are also given.

The proportion of brides and bridegrooms born in Canada is increasing. The average in 1941-45 was more than 10 p.c. greater than in 1931-35. In the western provinces, over one-third of the marriages solemnized in 1931-35 were between persons born outside Canada. In 1941-45, taking Canada as a whole, approximately 88 p.c. of all bridegrooms and 92 p.c. of all brides were born in Canada. In the western provinces the proportions were 76 p.c. and 86 p.c., respectively. The higher proportion of marriages between persons born in Canada is due to the restricted immigration of recent years.

Age and Marital Status of Brides and Bridegrooms.—The distribution of brides and bridegrooms by age and marital status is shown in Table 36. Nearly 90 p.c. of marriages are between persons who have not previously been married. The average age at marriage of bachelors is about 27 years and that of spinsters between 24 and 25 years. The average age of widowers and widows at the time of re-marriage is more than 20 years higher than that of bachelors and spinsters, being 50.3 years in 1940-42 and 51.5 in 1946 for widowers and 46.4 and 43.1, respectively, for widows. The age distribution of widowers and widows at the time of re-marriage is, of course, very different from that of bachelors and spinsters.

Widowers and widows were each 5 p.c., of all bridegrooms and brides in 1946. This compares with 3·8 and 2·7 p.c. respectively, in 1940-42. Marriages of divorced persons made up 3·1 p.c. of the total.

Religious Denominations of Brides and Bridegrooms.—The distribution of brides and bridegrooms by religious denominations is roughly the same as that for the population as a whole. Table 37 shows the very strong influence that religion has on marriage. Approximately 70 p.c. of all marriages are between persons of the same religious denomination. For all denominations except Anglicans, Lutherans, Baptists, and Presbyterians the proportion of brides and bridegrooms of the same denomination is over 60 p.c.; among those of Jewish faith, it was 95 p.c. in 1946; and among Roman Catholics 90 p.c.

¹ Less than one-tenth of one per cent.² Percentage of marriages between contracting parties of the same religious denomination.³ Including Greek Catholic.

Subsection 2.—Dissolutions of Marriage (Divorces)

For many years after Confederation, the number of divorces in Canada was very small. It was less than 20 in every year before 1900. There were 23 divorces in 1903, 51 in 1909 and 60 in 1913. These numbers were less than 1 per 1,000 of the yearly number of marriages.

One effect of the First World War was to increase the number of divorces. The generally unsettled conditions and the long separation between men on Active Service and their wives contributed to this increase. Changes in law and procedure which made it easier to obtain divorce was a further factor. At present, Quebec is the only province in which applicants for divorce must secure a private Act of Parliament.

There were 114 divorces in Canada in 1918 and 608 in 1926; the number had increased to 700 by 1931, 1,570 by 1936 and 2,369 by 1940. In every year since then the number has been higher than in the year before. The figures for the most part cover only final decrees of dissolution of marriage which alone constitute divorces; annulments and legal separations are excluded.

The statistics of dissolutions of marriage were revised in 1941 with the co-operation of the provincial authorities and the Clerk of the Divorce Committee of the Senate of Canada.

Section 7.—Vital Statistics of Yukon and the Northwest Territories

The vital statistics of Yukon and the Northwest Territories have been collected since 1924. These statistics are not presented with those of the nine provinces in the tables of this Chapter, because the figures are not considered complete. The details are in many cases not available, and the small and varying population of each year is not accurately known.

Section 8.—Communicable Diseases

The national reporting of communicable diseases in Canada was undertaken, in 1933, by the Dominion Bureau of Statistics, at the request of the Federal Department of Pensions and National Health in co-operation with the Provincial Departments of Health. Since then, the Vital Statistics Division of the Bureau has been responsible for the weekly compilation and analysis of communicable diseases except for a short period in 1939-40, when the work was transferred to the Department of Pensions and National Health. Under arrangements with the Department of National Health and Welfare, the Vital Statistics Division is now analysing the accumulated records of communicable diseases in its files, many of which date back to 1924. The reports of cases of venereal diseases are included in the current analyses and a standard report form is used by all the provinces.

Table 40 shows the number of cases of communicable diseases reported to the Dominion Bureau of Statistics by the Provincial Departments of Health in 1946. The reporting of two diseases, dysentery and rubella, is not compulsory in all provinces. The totals for Canada should, therefore, be considered with caution.

PART I.—PUBLIC HEALTH

Section 1.—Administration

In Canada matters of public health are administered by Federal and Provincial Governments through their respective Health Departments.

The Federal Government has jurisdiction only over those public-health matters that are exclusively international, national and interprovincial.* It makes grants to Provincial Departments of Health and to voluntary organizations engaged in public-health work. An important development was inaugurated on May 14, 1948, when the Government's health program was announced, including annual grants totalling approximately \$30,000,000 to the provinces for health services and hospital construction. Following this announcement Parliament appropriated, for the year ended Mar. 31, 1949, funds for the following grants: health survey, \$625,000; hospital construction, \$13,000,000; general public health, \$4,395,000; tuberculosis control, \$3,000,000; mental health, \$4,000,000; venereal disease control, \$275,000 (in addition to the existing grant of \$225,000); crippled children, \$500,000; professional training, \$500,000; public health research, \$100,000; and cancer control, \$3,500,000. The grants will be provided under the terms and conditions approved by the Governor in Council.

The Dominion Council of Health, created originally in 1919, is responsible for correlating and co-ordinating the activities of Provincial Departments of Health; it comprises the Deputy Minister of Health of each of the provinces as well as a representative of agriculture, labour, and urban and rural women, respectively, and a scientific adviser on public health.

Subsection 1.—Public Health Activities of the Federal Government

The Act of Parliament (8 Geo. VI, c. 22, 1944) creating the Department of National Health and Welfare clearly defines its functions. The Department is

* Treatment for ex-members of the Armed Forces is provided by the Department of Veterans Affairs.

divided into two branches. The functions of the Welfare Branch are given at pp. 251-258 and pp. 265-266; those of the Health Branch are: to maintain a maritime and aerial navigation quarantine for excluding infectious diseases; to advise the Immigration Service regarding the health of immigrants; to provide medical care for sick and injured seamen serving on vessels paying sick mariner service dues; to supervise the health conditions of workmen engaged on public works; to be responsible for the care of the health of Indians and Eskimos; to set the standards and control the quality of food and drugs; to control the importation, exportation and distribution of habit-forming narcotic drugs; to care for lepers; to promote and conserve the health of government employees; to furnish medical advice required in implementing pensions for the blind; to administer the Proprietary or Patent Medicine Act; to advise the Canadian Broadcasting Corporation in regard to broadcasts relating to health.

The Department is also empowered to assist the provinces by conducting investigations and research into public-health problems, and by co-operating with them in the preservation and improvement of health. Studies of existing facilities and future requirements in the fields of medical, hospital and related services and investigations of various methods of providing such services, including health insurance, are continuing.

To carry on its activities the following Directorates and Divisions have been organized within the Health Branch:—

Directorate of Health Services
 Blindness Control
 Child and Maternal Health
 Civil Service Health
 Dental Health
 Epidemiology
 Hospital Design
 Industrial Health
 Mental Health
 Narcotics
 Nutrition
 Public Health Engineering
 Civil Aviation Medicine

Quarantine, Immigration and Sick
 Mariner Service
 Venereal Disease Control
 Laboratory of Hygiene

Directorate of Indian Health Service

Directorate of Food and Drug Divisions
 Inspection
 Laboratory
 Proprietary and Patent Medicine

Directorate of Health Insurance Studies

The National Physical Fitness Program.—This program has a close association with both health and welfare. It is, however, administered under the Welfare Division and is dealt with at pp. 265-266.

Subsection 2.—Public Health Activities of the Provincial Governments

Prince Edward Island.—During the session of the Legislature in March, 1946, the Department of Public Welfare, which administered both health and welfare, was reorganized under the title of "Health and Welfare" with one Minister responsible for both divisions. The Health Division is under the supervision of the Chief Health Officer, who superintends the work of the Central Division, including the Provincial Laboratory and the Nursing and Sanitary Division. The Province is divided into five Districts: a public health nurse is assigned to each District and is responsible for the inspection of school children, home visiting, home-nursing classes, immunizing clinics, etc. One nurse specially trained in the treatment of venereal disease and another specially trained in combating tuberculosis have the entire Province as their field of operation. The Provincial Laboratory, operated by a Laboratory Director and a competent staff, is of great assistance to the practising physicians of the Province.

The Provincial Government operates, at Charlottetown, a Provincial Sanatorium of 145-bed capacity under a Board of Commissioners and an annual grant is made to assist ex-sanatorium patients when required and to help indigent tubercular persons awaiting admission and their families. Field work in the diagnosis and treatment of tuberculosis is one of the responsibilities of the Health Division and clinics are held periodically at central points in the Province. The Prince Edward Island Tuberculosis League, a voluntary organization, works in close co-operation with the Provincial Sanatorium and Health Division. A 20-bed hospital is also maintained for crippled children at the Provincial Sanatorium.

Annual grants are made to the general hospitals which, in turn, accept as free patients all indigent persons requiring hospital treatment. Expenses in connection with the operation of a hospital for the insane are borne practically in full by the Provincial Government.

The Department of Health operates two venereal disease clinics, one at Charlottetown and the other at Summerside; hospital beds are provided for selected cases. All necessary medication is supplied free of charge to persons who are not within reach of public-health clinics.

Nova Scotia.—The Nova Scotia Department of Public Health, with headquarters at Halifax, carries on a generalized public-health program throughout the Province. Attached to the central office are: the Minister of Health, a Deputy Minister, an Assistant Deputy Minister, an Inspector of Hospitals and Humane Institutions, a Superintendent of Public Health Nursing, a Public Health Engineer, a Director of Physical Fitness, a Supervisor of Physical Education, two Assistant Supervisors and two Nutritionists. The central office also includes Divisions of Laboratories (Bacteriological, Pathological, Industrial Hygiene) and Neuropsychiatry.

Four provincially owned hospitals are operated under the direction of the Health Department: a general hospital, two tuberculosis sanatoria and a mental hospital. A cancer clinic and a "Kenny" treatment clinic for poliomyelitis are attached to the general hospital.

Outside of Halifax the Province is divided into six health divisions with competent directors. Each has its staff of public-health nurses, sanitary inspectors, clerks and stenographers and has portable X-ray and other necessary apparatus. The services offered by these units are health education, communicable disease control, environmental sanitation, public-health nursing and maternal, infant and child hygiene. These divisions are directed and controlled by the Provincial Department of Health and with one exception they are completely financed by the Province.

The Halifax City Department of Health has recently been completely reorganized and modernized. Here a trained staff under the leadership of a Commissioner, with some financial assistance from the Province, is rendering an up-to-date service covering all the usual public-health activities. This organization constitutes another health division.

In the development of health services in Nova Scotia, particular attention has been given to the employment of trained persons and to the further training of those already employed. No factor in health organization is more important than having the various bureaus headed by competent persons. The soundness of this principle has been demonstrated by the results obtained in recent years.

New Brunswick.—In 1918 the Legislature of New Brunswick established a Ministry of Health. Under the Minister the Department is directed by a Chief Medical Officer who is also Registrar General of Vital Statistics. In addition, the Department maintains seven full-time Medical Health Officers, a Director of Nutrition, a Director of Public Health Nursing, a Director of Venereal Disease Control Division and an Assistant Registrar General.

Recent additions to services and staff consist of:—

- (1) A Director of Hospital Services, appointed effective June 1, 1947, whose duties are generally concerned with all phases of hospital service in the Province;
- (2) A Sub-Zone Laboratory, under a qualified Director, officially inaugurated on June 1, 1947, as part of the Provincial Bureau of Laboratories;
- (3) A Sanitary Engineer, appointed effective Aug. 1, 1947, under whose direction and supervision the problems of sanitation, water supply and sewerage will receive competent attention;
- (4) A Director of Cancer Diagnostic Service, appointed Aug. 6, 1947, to organize Cancer Diagnostic Clinics in various hospitals throughout the Province for a trial period of one year;
- (5) A Director of Tuberculosis Control Division, appointed effective Oct. 15, 1947, under whose supervision is centralized all work in connection with tuberculosis.

The Department provides the following services: general sanitation, control of communicable diseases including tuberculosis and venereal diseases, the supply of biologicals, medical inspection of schools, child-welfare work, health education, nutrition, and general supervision and co-ordination of the work of the Sub-District Boards of Health.

The Province assumes all the costs of sanatorium care for tubercular patients, all hospital care for victims of poliomyelitis during the acute and immediate post-paralytic stages, and about 60 p.c. of the cost of hospital care for mental patients.

Quebec.—The Provincial Government, by legislation passed in 1946, authorized the establishment of a Department of Social Welfare and Youth. Since then, the Ministry of Health, which in reality has existed since 1936, deals only with matters relating to health, preventive medicine and public charities. From 1936 to 1941 provincial health matters were under the Department of Health which, in the former year, replaced the Health Service that operated under the Provincial Secretary. Since 1926 a system known as "County Health Units" has been in operation, the purpose of which is to provide a regular full-time service for each county or group of two or three adjoining counties included in the scheme. There are now 63 units of this kind, covering 74 counties. The Health Officers of the old districts, whose number is now reduced to seven, supervise the few counties not organized into units. Many municipalities, such as Montreal, Sherbrooke, Westmount and Quebec, have their own Health Bureaus.

The Department of Health maintains, in addition to its administrative service, the following divisions: Laboratories, Sanitary Engineering, Demography, Mental Health, Public Charities, Health Districts and Units, Epidemiology, Industrial Health, Nutrition (including Maternal Hygiene and Child Welfare), Venereal Diseases, Tuberculosis, Health Education, Dental Health Education, Publicity, etc.

Service is rendered in the form of consultations, public lectures, school inspections, itinerant clinics of pediatry and tuberculosis, inquiries of all kinds, immunizations, sanitation improvement, etc. Twenty-seven anti-tuberculosis dispensaries have been established and 70 clinics of pediatry, including those sponsored by the Provincial Government.

An Act was introduced at the 1946 session of the Quebec Legislature designed to combat the spread of tuberculosis in the Province. This Act authorized the Minister of Health to organize facilities for the detection of cases of tuberculosis and to contribute to the construction and maintenance of sanatoria for consumptives and the training of specialists in the treatment of the disease as well as to carry on educational campaigns in the fight against tuberculosis. An Advisory Board was also set up to ensure the practical and efficient carrying out of the legislation.

Ontario.—The Department of Health is organized under a Minister, a Deputy Minister who is also Chief Medical Officer, and an Assistant Deputy Minister.

The public-health services of the Department are organized under the following branches: Public Health Administration; Public Health Nursing; Maternal and Child Hygiene; Dental Services; Epidemiology; Venereal Disease Control; Tuberculosis Prevention; Industrial Hygiene; Laboratory Services; Administration of Mental Hospitals; and Sanitary Engineering. There are also branches for the supervision of certain aspects of medical treatment centres throughout the Province, including public general and private hospitals and nurse registration. Under Public Health Administration, 20 Health Units staffed by qualified personnel were in operation on Dec. 31, 1947.

The objectives of the Public Health Nursing Branch are: (a) to interest and instruct local Boards of Health in the organization and development of public-health nursing services; and (b) to co-operate with voluntary health, nursing and related agencies. Financial assistance is given to registered nurses, under certain conditions, for post-graduate study in public-health nursing.

The Maternal and Child Hygiene Branch is responsible for the implementation of a 1946 amendment to the Public Health Act which provides for one free medical examination during any one pregnancy of resident expectant mothers. The Government absorbs this cost and remunerates the physician, chosen by the applicant, for his services. During 1947, 40 to 50 p.c. of the expectant mothers availed themselves of this provision.

The Dental Service concerns itself with the dental clinics operated in Ontario hospitals and in the institutions under the Department of Reform Institutions, interests itself in dental health education programs, and provides grants-in-aid to local Boards for dental service. A railway dental car is maintained to serve certain areas in the northern part of the Province.

Epidemiology distributes free biologicals and other materials for the control and prevention of acute communicable diseases and supplies gratuitously certain test materials. Free insulin is also distributed.

Venereal Disease Control provides consultative and advisory services, interests itself in education programs, distributes certain drugs free of charge, and extends grants-in-aid to some 17 clinics strategically placed throughout the Province.

The Tuberculosis Prevention Branch maintains four chest clinics at various points in the Province and operates three travelling mass-survey units, two of these

employing modern, mobile equipment put into operation in 1947. It is administratively responsible for payments made on behalf of patients receiving free sanatorium care.

The Division of Industrial Hygiene is responsible for the control of occupational diseases and acts as adviser to the Factory Inspection Branch of the Labour Department, the Workmen's Compensation Board and industry generally.

In addition to the Central Laboratory, there are 15 branches of which nine are designated as regional and six as subsidized. Divisional Laboratories carried out 1,260,155 specimen examinations in 1947.

The Division of Sanitary Engineering administers all legislation affecting water supplies, sewerage systems, stream sanitation, refuse disposal, milk and food sanitation, frosted-food locker plants, cemeteries, recreational sanitation and all other forms of environmental sanitation.

The Division of Nurse Registration concerns itself with the training of student nurses, registration and the regulation of reciprocal registration with other provinces and countries.

In 1947, financial aid was extended to six doctors, 30 nurses, one veterinarian and three sanitary engineers to assist them in the pursuit of studies in public health. Grants-in-aid were also paid to the six County Public Health School Nursing Services operating in 1947. Fifteen hospitals are administered and operated by the Director of the Mental Health Branch. A second hospital training school is under construction. Three special units concern themselves with the care of epileptics, the tuberculous and the criminally insane. This Branch also organizes and operates travelling clinics and is assisted by district consultant psychiatrists.

Serving all Branches of the Department of Health as required are the Legal Branch and the Medical Statistics Branch.

Legislation concerning public health passed in 1947 included: the Nurses Act, 1947, under which provision was made for the registration of certified nursing assistants; the Sanatoria for Consumptives Act which consolidated the 1937 Act and subsequent amendments; amendments to the Public Health Act authorizing the prescribing of standards for the construction, operation and maintenance of premises where food or drink for human consumption is manufactured or handled and regulating or restricting the manufacture or selling of such food or drink; also amendments to the Dentistry Act and the Public Hospitals Act.

Manitoba.—The Health and Public Welfare Act states that the Minister shall preside over, and have the management and direction of the Department, and the Department shall have administrative jurisdiction over all matters in the Province that relate to health and public welfare. The Department is organized into four main Divisions: General Administration; Health Services; Psychiatric Services; and Welfare Services.

The Division of General Administration includes the general executive offices, and the Sections of Farms Management, Statistics and Records, Accountancy, Health and Welfare Education, and Administrative Research.

The Division of Health Services has four Sections: (1) Environmental Sanitation, which consists of the Bureaus of Public Health Engineering, Food and Milk Control, and Industrial Hygiene. The latter Bureau takes care of the many hazards to personnel in industry. (2) Preventive Medical Services, which consists of the Bureaus of: Disease Control, responsible for the control of acute communica-

able disease, venereal diseases and tuberculosis; Maternal and Child Hygiene, responsible for an educational program in maternal, infant, pre-school and school health; Public Health Nursing, responsible for nursing education, field supervision, licensing and control of practical nurses, registry for crippled children, and general administration of all public-health nursing services. (3) The Extension Health Services Section administers the provisions of the Health Services Act, and consists of the Bureaus of: Local Health Services, responsible for the establishment, supervision, and general administration of local health units throughout the Province, the control of local part-time medical officers of health, consultative services to local and municipal health departments in Manitoba; Diagnostic Services, responsible for the establishment and general administration of diagnostic units set up in general hospitals in Manitoba; Medical Care, responsible for the approval of contracts for pre-payment medical care between a municipality, or municipalities, and the contracting physician, and for the payment of Provincial Government grants to the municipalities in aid of such service; Hospitalization, responsible for the organization and supervision of the establishment of hospital districts, medical-nursing units and hospital areas, together with the supervision of hospitals throughout the Province and the payment of Provincial Government grants to them; and the Bureaus of Dental Services, Physical Fitness and Nutrition Research. (4) Laboratory Services.

The Division of Psychiatric Services consists of the Bureaus of: Mental Institutions, responsible for the supervision and control of the four institutions—the Psychopathic Hospital, Winnipeg, the Hospitals for Mental Diseases at Selkirk and Brandon, and the Manitoba School for Mentally Defective Persons at Portage la Prairie; and Community Mental Health Services, responsible for out-patient services, child-guidance clinics, services to courts and child-caring agencies, boarding-home care for the mentally ill, and teaching facilities.

Welfare services of the Department are dealt with in Part II of this Chapter at p. 269.

Saskatchewan.—The Department of Public Health consists of 13 Divisions: (1) Administration; (2) Public Health Nursing conducts a program of public-health nursing, infant and maternal welfare, school work, venereal disease, epidemiology, etc., and supervises maternity grants; (3) Communicable Diseases distributes free vaccines and sera to doctors and hospitals and supervises anterior poliomyelitis clinics, boards of health, medical health officers, medical examination of food-handlers, burial, disinterment and transportation of the dead and promotes immunization programs; (4) Sanitation has supervision of water-works, sewerage systems and drainage, food supplies including milk, and urban and rural sanitation; (5) The Division of Laboratories does routine public-health work in bacteriology, serology, chemistry and pathology and provides clinical diagnostic laboratory service for rural physicians; (6) Vital Statistics; (7) Mental Services has the care and treatment of patients in institutions for the mentally ill and mentally defective and of patients in the psychopathic ward at Regina, and the supervision of mental hygiene clinics; (8) Venereal Disease Control administers diagnostic and treatment services, epidemiology, and education; (9) Health Education conducts a program for modifying public opinion in favour of higher standards of health; (10) Nutrition creates interest in better food habits, emphasis being placed on nutrition of children with special attention to school lunches; (11) Physical Fitness and Recreation stimulates, organizes and assists social, cultural and athletic activities; (12) In-

dustrial Hygiene provides a consulting service on matters pertaining to industrial health; (13) Air Ambulance Service provides emergency service at a nominal charge of \$25 per flight.

The Province is divided into 13 health regions, five of which have been established. The Cancer Commission of the Department of Public Health has established consultative, diagnostic, surgery and treatment clinics at Regina and Saskatoon. Radon is manufactured at a plant in Saskatoon. Free treatment for cases of poliomyelitis is available at Saskatoon and Regina. Free diagnostic and treatment services are available for tubercular patients in three sanatoria and a number of clinics operated by the Saskatchewan Anti-Tuberculosis League. Annual surveys are carried out throughout the Province.

The Health Services Planning Commission supervises all hospital planning and administration, and all approved hospitals and nursery homes. It acts as an advisory and consultative body to local regions, municipalities, local improvement districts, mutual benefit and hospital associations, and Union hospitals and is responsible for the administration of medical care grants; it assesses hospital facilities and advises on needed hospital expansion. It must approve by-laws and contracts for all types of municipal health schemes. It administers the Saskatchewan Hospital Services Plan which provides for hospital care for every resident of the Province. The Medical Services Division of the Health Services Planning Commission supervises payment of grants to physicians, dentists and approved hospitals for services to needy residents of the Province outside municipal jurisdiction; insulin is supplied free to diabetics who are unable to purchase it; medical, hospital and drug services are provided to old age and blind pensioners and their dependents, and to recipients of mothers' allowances and their children.

Alberta.—The Department of Public Health administers all public-health matters in the Province and includes the following Divisions: Communicable Diseases; Sanitary Engineering and Sanitation; Public Health Education; Public Health Entomology; Laboratory; Tuberculosis Control; Public Health Nursing; Municipal Hospitals; Hospital and Medical Services; Social Hygiene; Vital Statistics; Mental Hygiene; Cancer; and Nutrition Services.

The following institutions are administered by the Department: Central Alberta Sanatorium; the Provincial Mental Hospital, Ponoka; the Provincial Training School, Red Deer; the Provincial Auxiliary Hospital, Claresholm; the Provincial Auxiliary Hospital, Raymond; the Provincial Mental Institute, Edmonton; Roschaven Home, Camrose.

Free clinics for venereal disease are maintained at the following centres: Edmonton, Calgary, Medicine Hat, Lethbridge, Peace River, High Prairie, McLennan, and in the two provincial gaols. Arsenicals, penicillin and sulpha drugs are provided free of charge to all private physicians treating venereal disease. Educational work on social hygiene is carried on by means of lectures, moving pictures, bulletins and radio talks.

Free treatment for pulmonary tuberculosis is provided for any person who has resided in the Province for at least one year immediately preceding admission for treatment in the sanatorium. In addition to this service, two mobile X-ray clinics are in operation; the personnel is supplied and the clinics are maintained by the Provincial Department of Public Health while the equipment is furnished by the Alberta Tuberculosis Association.

Provision is made for the free treatment in special hospitals of patients suffering from poliomyelitis. Provision is also made for academic instruction, vocational training and rehabilitation of those suffering from paralysis resulting from this disease.

Weekly diagnostic cancer clinics have been established at Edmonton and Calgary. Patients found to require deep X-ray radium therapy or surgery are treated free of charge. Hospitalization necessary to establish diagnosis may be authorized up to a maximum of 14 days.

Any maternity patient who has been a resident of the Province for 12 consecutive months out of the 24 immediately preceding admission, is entitled to free hospitalization for herself and child for a maximum period of 12 days.

Alberta's Rural Health Districts, of which there are 17, have been operating successfully since 1931; 36 district nurses provide diversified medical and public-health service in outlying districts.

Each party to a marriage contract is required to have a specimen of blood forwarded to the Provincial Laboratory or other approved laboratory for serological examination.

Municipal Hospitals.—There are 51 municipal hospitals in operation, with three under construction and five additional districts contemplating coming under the Act. Municipal hospitals reporting in 1946 had a total bed capacity of 1,334; patients admitted numbered 37,571 and total hospital days 305,922; 4,849 maternity patients were admitted and 4,624 babies born; major operations performed numbered 3,331, minor operations 6,810 and 16,525 medical cases were treated; graduate nurses employed numbered 247. The average patient day cost of operation was \$4.38 and the average revenue per patient day was \$4.83. The approximate population served by these hospitals was 268,940, covering an area of over 30,000 square miles.

Hospital, Medical and Dental Services for Pensioners.—Free hospitalization and treatment services are provided for all Alberta residents receiving blind pensions, old age pensions and mothers' allowances as well as for the dependents of such persons.

Dental service is complete for recipients of mothers' allowances and blind pensions and their dependents. Old age pensioners receive dental services with the exception of dentures.

British Columbia.—The Department of Health and Welfare, with one Cabinet Minister, has two branches under the supervision of the Deputy Minister of Health and the Deputy Minister of Welfare, respectively.

Within the Health Branch, the Bureau of Local Health Services supervises public-health activities pertaining to the local level. Outside Greater Vancouver and Victoria, which have their own Health Departments, these local public-health services are provided through: (a) Health Units or (b) Public Health Nursing Districts or (c) certain practising physicians who serve as part-time Medical Health Officers. With the exception of (c) and those in the two cities mentioned, public-health personnel are all employed by the Provincial Department.

The boundaries of a Health Unit are such that the area served includes several school districts. The staff consists of a physician with post-graduate training in public health, several public-health nurses also with post-graduate training, one

or two sanitary inspectors who are required to hold the Certificate of the Canadian Institute of Sanitary Inspectors, and a statistical clerk. Nine of the 16 Units planned are in operation.

A Public Health Nursing District, like a Health Unit, covers several school districts. It is considered to be a forerunner of a Health Unit and is staffed by nurses with the same training as those in the Health Units.

In both types of service a generalized program is conducted. The tendency, however, is to give special training to consultants and supervisors who then serve in a consultative capacity in their specialty in the Province as a whole as well as supervise the generalized program in their own areas.

Approximately one-third of the cost is borne by the local districts and the remainder of the cost is borne by the Provincial Department of Health except in the two metropolitan areas where special grants are made under previous arrangements. Approximately 92 p.c. of the population of the Province is served by full-time trained public-health personnel.

Several specialized divisions of the Health Branch provide consultative service and guidance to the field staff, other departments of government, and agencies both official and voluntary. Located at Victoria are the Nutrition Services and the Divisions of Health Units, Public Health Nursing and Environmental Sanitation, which, together with the proposed Divisions of Industrial Hygiene and Preventive Dentistry, constitute the Bureau of Local Health Services.

Also at Victoria are headquarters of the Divisions of Vital Statistics and Public Health Education which are grouped in the Bureau of Central Administration.

The Divisions of Tuberculosis Control, Venereal Disease Control and Laboratories have their headquarters at Vancouver, and are grouped in the Bureau of Special Preventive and Treatment Service.

Section 2.—Institutional Statistics*

Under authority granted by the Federal Government in 1930, the Dominion Bureau of Statistics has, since that date, co-operated with the provincial authorities through the Census of Institutions, and now collects, on a Dominion-wide basis, statistics for the following types of institutions: (1) *Hospitals*—institutions primarily engaged in the prevention, cure or alleviation of physical sickness and disease, such as hospitals for the sick, sanatoria, and institutions for incurables and those under the heading "Dominion" in Table 1. (2) *Mental and neurological institutions*—such as asylums for the insane, institutions for the feeble-minded, epileptic, etc., devoted to the treatment and care of mental ailments. (3) *Charitable and benevolent institutions*—caring for the poor and the destitute of all ages, such as homes for the aged, county refuges, orphanages, etc. The latest statistics available regarding charitable institutions appear at pp. 677-682 of the 1943-44 Year Book. Statistics of penal and corrective institutions are also collected through the Census of Institutions; they are dealt with under Crime and Delinquency at p. 308.

* Except as otherwise noted, this Section has been revised under the direction of J. T. Marshall, Director, Health and Welfare Division, Dominion Bureau of Statistics, by J. C. Brady, Chief, Institutions Statistics.

For Canada as a whole, 595 public hospitals reported in 1946, of which 505 were general hospitals. Of the total public hospitals reporting, 507 had X-ray facilities; 329 had clinical laboratories; and 262 had physio-therapy facilities.

During the year, patients receiving treatment numbered 1,504,893; admissions numbered 1,254,807; discharges, 1,423,834; live births 210,482; and deaths, 40,045. Figures that met the requirements of the Bureau of Statistics were provided by 519 hospitals which reported total collective days' stay numbering 16,367,925; receipts, \$85,601,948; expenditures, \$84,502,748; and average cost per patient day, \$4.76.

¹ The following general hospitals did not report for 1946: Prince Edward Island, 3; New Brunswick, 2; Quebec, 3; Manitoba, 1; Saskatchewan, 1; Alberta, 5; British Columbia, 3.

² These institutions are

classified in detail in Table 1.

³ Three Red Cross hospitals in Nova Scotia did not report.

⁴ One contagious-diseases hospital in Alberta did not report.

Organized Services in Public General Hospitals.—Organized services, which are analysed in Table 4, may be defined as specialized hospital departments or services in charge of specialists with up-to-date equipment and a technical staff specially devoted to problems in the indicated fields. Facilities available in a hospital merely for the use of general practitioners are not considered as organized services. Organized services in public general hospitals only are considered here but it is in these hospitals that the majority of such services are found. Many of the smaller public general hospitals have facilities for study and treatment in the fields indicated, but since they are not organized services as defined above, such facilities are not included in the figures. In 1946, of the 505 public hospitals, 290 had organized medical staffs with 10,912 staff doctors.

4.—Organized Services and Staffs in Reporting Public General Hospitals, by Provinces, 1946

NOTE.—A dash in this table means that an organized service was not reported.

¹ In addition to these totals, there were the organized services and staffs of 28 hospitals which did not make returns on specific services. There were no organized services reported in Yukon and Northwest Territories hospitals.

Out-Patient Departments.—Out-patient departments are operated in connection with hospitals or other institutions, and treat patients who do not occupy beds in the hospital. The extension of out-patient services to patients of modest means has far-reaching and beneficial effects. It may replace admission to hospital, or may serve to secure necessary and beneficial hospitalization. As a general rule out-patient departments are subsidized from the funds of the general hospital and separate records are not kept. Until a uniform system of accounting is adopted, it will not be possible to give the average cost per patient.

5.—Out-Patient Departments of Public Hospitals, by Provinces, 1946

NOTE.—Figures of tuberculosis sanatoria and government and municipal clinics held in hospitals are not included.

Province	Out-Patient Departments	Patients	Treatments
New Brunswick.....	2	22,232	33,843
Quebec.....	28	319,958	980,201
Ontario.....	18	165,309	487,275

British Columbia.....	2	39,040	69,072
Totals.....	57	581,009	1,672,842

Tuberculosis Institutions.—The statistics regarding institutions for the treatment of tuberculosis shown in Table 6, include special units for the treatment of tuberculosis in general hospitals and Dominion hospitals as well as the specialized sanatoria shown separately in Table 1. Deaths in these institutions from tuberculosis in 1946 were 41.2 p.c. of the total deaths from the disease in Canada as shown under Vital Statistics at p. 209 of this edition. However, the death rate from this disease has shown an encouraging decline since 1926.

¹ Four units in public hospitals at Vancouver and Victoria are operated by the Provincial Board of Health and are included with Sanatoria. ² Sanatoria only (exclusive of units in other hospitals). ³ Includes other personnel.

Subsection 2.—Statistics of Federal Government Hospitals

Hospitals operated by the Federal Government are conducted for special purposes connected with departmental administration such as the care of war veterans and members of the Permanent Force, the quarantine and care of immigrants and lepers, the care of Indians as wards of the Government, etc. Table 1 shows the number of Dominion hospitals compared with those in other categories for 1946.

Department of Veterans Affairs Hospitals.—There was considerable adjustment in the hospital accommodation during the calendar year 1947. Eleven of the Service hospitals which had been taken over and operated by the Department

were closed, leaving 6 of this group in active operation. Of the new construction coming into use 300 replacement beds were added; these were in Sunnybrook hospital, Toronto.

Throughout the year plans were formulated to replace obsolete accommodation and improve facilities in all Districts. About 1,250 beds are expected to come into use during the calendar year 1948.

Active Treatment Hospitals provide treatment for general medical and surgical conditions. In the larger institutions, facilities are available for orthopaedic surgery, plastic surgery, neuro-surgery, neuro-psychiatry, the treatment of arthritis, etc.

Four special centres are maintained in conjunction with larger hospitals for the care of paraplegics, which care is now available to non-veterans under certain conditions. In addition, special treatment centres are operated for the care of tuberculosis and neuroses. Active convalescent facilities are provided in seven Health and Occupation Centres. There are nine veterans homes which provide domiciliary care for veterans requiring it.

Accommodation and movement of patients is shown by type of hospital for 1947 in Table 7, while Table 8 gives monthly data re types of treatment and status of recipient.

7.—Accommodation and Movement of Patients in Veterans Affairs Hospitals, 1947

NOTE.—Patients in veterans pavilions attached to civilian hospitals are not included.

National Defence Hospitals.—Table 9 shows the accommodation and movement of patients in National Defence hospitals for the year 1947. All these hospitals are equipped with X-ray, laboratory and out-patient facilities and all but nine Army hospitals provide physio-therapy services.

In addition, there are completely equipped 10-bed sick quarters (Royal Canadian Air Force) available for emergency use at Aylmer, Centralia and Clinton in Ontario, Dartmouth, Nova Scotia, and at Edmonton and Calgary in Alberta. Hospitalization in these areas is carried out in existing Veterans Affairs hospitals or civilian hospitals. There were 423 admissions to the emergency centres and 422 discharges during 1947, and approximately 32,000 out-patient treatments were given to Navy, Army and Air Force personnel, civilians, Eskimos and Indians in the R.C.A.F. emergency sick quarters and medical inspection rooms. These are in addition to out-patient treatments given at the hospitals.

There is also a hospital or sick bay in each ship of the Royal Canadian Navy, in commission, consisting of from two to 20 beds.

National Health and Welfare Hospitals.—Table 10 gives statistics of the hospitals administered by the Department of National Health and Welfare. The immigration detention hospital at Quebec, the largest of such institutions, has X-ray, laboratory and physio-therapy facilities as well as a social service and an out-patient department. The other hospitals are small and, with the exception of a clinical laboratory at Lunenburg and an out-patient department at Sydney, have no special services.

The low number of patient days at immigration hospitals, in contrast with the number of beds, is explained by the fact that these hospitals must maintain a sufficient number of beds to accommodate any sudden influx of patients whose treatment demands immediate quarantine.

Subsection 3.—Statistics of Mental Hospitals

At Dec. 31, 1946, there were 49,163 patients in mental institutions in Canada and 4,260 on parole or otherwise absent, making a total of 53,423. The normal bed capacity in these institutions was only 45,443, showing a seriously over-crowded situation if the patient population on Jan. 1, 1946, and the admissions and separations during the year are considered. This over-crowded condition was specially marked in New Brunswick, Quebec and the western provinces. Of the 49,163 resident patients in 1946, 37,208 were psychotic, 10,848 were mentally deficient, 700 were epileptic and 407 mental cases were otherwise classified.

The number of resident patients in mental institutions per 100,000 population on Dec. 31, 1946, was 399.5, as compared with 396.5 on the same date in 1945, 388.0 in 1940, 352.8 in 1935 and 305.4 on June 1, 1931.

Data are not available to indicate to what extent the increasing trend of patients per 100,000 population is due to more complete diagnosis and care than formerly, or to what extent there is an actual increase in the proportion of the population requiring treatment for mental diseases.

Section 3.—Auxiliary Health Services

Subsection 1.—The Victorian Order of Nurses for Canada

The Victorian Order of Nurses is a voluntary public-health agency, national in scope and having as its primary object the care of the sick in their own homes by visiting nurses. In 1947 there were 104 branches of the Order distributed as follows: Nova Scotia 16; New Brunswick 8; Quebec 5; Ontario 60; Manitoba 1; Saskatchewan 3; Alberta 3; and British Columbia 8. The affairs of each branch are directed by a local board, which raises the money necessary to carry on the work. However, the policies and professional standards set by the national organization are accepted by the branches. The Board of Governors of the national organization is made up largely of representatives appointed by the branches.

Registered nurses are employed by the Order and have, in addition, post-graduate training in public-health nursing. During 1947 approximately 476 nurses in the field gave nursing care to 128,518 patients.

The Order provides a community service available to everyone in the area served regardless of race, creed or economic status. The nurses give care on a visit basis to medical, surgical, and maternity patients under medical direction and thus serve a large group of people who would otherwise be without skilled nursing care. The budget of the average man makes very little allowance for the cost of illness. The patient is expected to pay the cost of the visit but the fee is adjusted to suit the family income and service is never refused because of inability to pay. Of the 906,127 visits made in 1947, 52 p.c. were free, 22 p.c. were paid, 16 p.c. were paid in part and 10 p.c. were paid for by insurance companies for care to patients. The cost of the service to those unable to pay is provided for by municipal grants and funds collected by means of campaigns.

In smaller centres where the Victorian Order nurse is the only public-health nurse the program of work is usually enlarged to include school nursing service, child-health centres, assistance at immunization clinics and other public-health services.

An increasing number of Victorian Order branches are giving part-time nursing service to industrial plants where the number of employees is not large enough to require the full-time services of a nurse.

Subsection 2.—The Canadian Red Cross Society

The purpose of the Canadian Red Cross Society is to furnish volunteer aid to the sick and wounded of armies in war and to work for the improvement of health, the prevention of disease and the mitigation of suffering throughout the world.

The free National Blood Transfusion Service, introduced in 1947, now functions in the Provinces of British Columbia and Alberta. In the first year of operation 32,062 bottles of blood were collected, 15,473 patients received transfusions and 1,748 patients received plasma. This service is being extended across the Dominion as building materials and sites become available.

The School Meal Study, begun in February, 1947, is designed to gather scientific information about the effect on school children of a nutritionally well-balanced lunch. Some 500 children are participating in the experiment.

The Red Cross Homemaker Service has established nearly 30 branches to give trained assistance in homes where the mother is ill or where there is no means of securing adequate care for the family.

The Canadian Nurses' Association plan for a new form of nurses' training received financial support from the Society in 1947. The Red Cross is financing a small demonstration school of nursing at a cost of \$40,000 a year for four years. The new curriculum is designed to shorten the training period to 25 months and make training more attractive.

More than 200 Sick Room Supply Loan Cupboards have been established in provincial branches. Sickroom supplies, rarely used or hard to obtain and often beyond a family's means, are distributed from a central depot without charge on request of the family doctor or a welfare agency.

Sixteen new outpost hospitals were added during 1947, making a total of 71 of these hospitals and nursing stations serving frontier districts across the Dominion.

The Arts and Crafts Department took over the operation of diversional therapy in 24 Department of Veterans Affairs institutions in the nine provinces. A staff of 38, with 85 volunteer workers assisting, provides instruction in recreational handicrafts. An average of 2,120 veterans participate monthly in this program. Ten Red Cross Lodges have been built by the Society and operate near veterans hospitals to provide recreational facilities and accommodation for visiting relatives.

During 1947 the Red Cross distributed in Canada approximately 1,500,000 articles of clothing and hospital supplies made by volunteer workers in the Women's Workrooms, to military, civilian, D.V.A. and outpost hospitals, to loan cupboards, soldiers' dependents and relief. Early in 1947, following the disastrous floods in Britain, \$500,000 was allocated to purchase clothing for relief. In addition, women volunteers made and shipped overseas approximately 1,200,000 articles.

First aid and home nursing is being taught by the provincial branches and the swimming and water-safety program has in two years qualified nearly 30,000 men, women and children in swimming and water-safety tests, another 10,000 receiving varying degrees of instruction. Some 2,000 new instructors have been qualified.

At the end of 1947, Canadian Junior Red Cross had 854,606 members in Canada and Newfoundland. More than 2,500 handicapped children were assisted during that year through their Crippled Children's Fund. Health promotion was maintained at a high level and many health projects initiated. A total of 1,846 cases, valued at approximately \$87,000 and containing school supplies, food, cod liver oil, clothing and toys, was shipped overseas by Juniors for relief of needy children in Great Britain and Europe.

Floods, forest fires and other disasters were met by the Disaster Relief Committees, which not only assisted in these emergencies but started rehabilitation funds where necessary. At the beginning of the year, \$1,500,000 was given to the Lord Mayor of London, England, for the Flood Distress Fund, not including the \$500,000 allocated for clothing. A \$1,000,000 grant was made in October, 1947, to purchase bulk food to ease the crisis in Great Britain and Europe in the coming winter. A total of 118,350 cases of supplies was shipped overseas during the year, including food, drugs, clothing articles, layettes, hospital equipment and comforts of every description for the relief of suffering and hardship.

In 1947 the Red Cross became the official welcoming committee for thousands of British immigrants arriving by air or by sea. A helping hand was extended at Red Cross Reception Centres in the various railway terminals across the country. Up to the end of the year, 6,204 immigrants passed through the Reception Centre at Toronto, Ont.

There were approximately 2,000,000 senior members of the Canadian Red Cross Society in 1947, and some \$5,000,000 was voluntarily subscribed in that year to carry on its peacetime work.

Subsection 3.—The Order of St. John*

The origin of the Order of St. John goes back to the Crusades and the Knights of St. John and Malta. His Majesty the King is supreme head of the Order which has headquarters at London, England, and units in all parts of the British Empire. In Canada the Governor General is the Prior and meetings of the Order are held at Government House. The organization in Canada is the Priory in Canada of the Grand Priory of the British Realm of the Venerable Order of the Hospital of St. John of Jerusalem, usually referred to as the Order of St. John.

The Priory in Canada has its headquarters and national offices at St. John House, Ottawa, Ont., with branches in every province and local centres in hundreds of cities and towns throughout Canada. There are two distinct branches: the Association whose members train instructors, conduct classes and issue various certificates; and the Brigade, members of which are in uniform under a form of military discipline, receive constant supplementary training, and are available for call whenever the need arises. The Brigade strength is approximately 15,000 persons, about equally divided between the Ambulance Division (men) and the Nursing Division (women), and organized into about 325 divisions.

The primary purpose of the Association is to teach first aid and home nursing and other kindred subjects to citizens of Canada, irrespective of age, and to provide trained and organized personnel to help in time of disaster or national emergency. The work was started in 1895 and since then more than 1,000,000 persons have received certificates and other awards. Many thousands of these went to members of the Armed Forces to which trained instructors and textbooks have been provided in large numbers. The railways of Canada and many large industrial concerns maintain their own St. John centres. At port cities the Order assists the regular R.C.A.M.C. doctors and nurses, helps in hospitals and merchant seamen's hostels and also assists shipwrecked seamen. Uniformed St. John Brigade members are to be found at all exhibitions, large demonstrations or wherever crowds gather. St. John First Aiders have also proved their worth on the ski-runs in the Laurentians, on Mount Royal, on the Gatineau Hills, at Fort William and other places where skiing is one of the major Canadian sports.

The Order of St. John is carrying on an extensive peacetime program of home nursing, first aid, child welfare and blood grouping. The training of Brigade members as blood-typing technicians was commenced in 1943. The entire personnel of large industrial firms is being typed so that, in the event of serious accident, blood transfusions may be given in the quickest possible time.

Subsection 4.—The Health League of Canada

The Health League of Canada is a voluntary association devoted to a program of health education, especially in the field of disease prevention, and to the support of the work of official departments of health. In brief, the aims of the Health

*Including the St. John Ambulance Association and the St. John Ambulance Brigade.

League are: to prevent illness, conserve health, and prolong life; to encourage public support of all wise health legislation; to enlist the co-operation of the public in official and professional efforts to control communicable disease and to improve public sanitation and health; and to conduct a broad and continuing educational campaign to promote personal, family and community hygiene throughout Canada.

When it was formed, at the request of the Federal Government in 1919, the organization was known as the Canadian Council for Combating Venereal Diseases. In 1922 the name was changed to the Canadian Social Hygiene Council. By 1935 the organization had departed from its original limited program and had developed a broad one of health conservation. It was then that the name—Health League of Canada—was adopted.

The Health League is especially interested in campaigning for and obtaining passage of milk pasteurization legislation throughout Canada; immunization of all children against such preventable diseases as diphtheria, smallpox and whooping cough; good eating habits through proper nutrition; good health for industrial workers; the eradication of venereal diseases; and sanitary work practices by public food-handlers.

PART II.—SOCIAL SECURITY AND WELFARE

Public measures to meet need may be divided into two main categories depending on whether they are designed primarily to provide financial aid on account of interruption or stoppage of income through unemployment, illness, age or other reasons, or to meet needs rooted in problems of individual, family, or community relationships. Generally speaking, the first takes the form of broad social insurance and assistance programs with such auxiliary welfare services as appear necessary. In the second, the emphasis is primarily on skilled treatment measures as, for example, family counselling and child protection and guidance services, although maintenance may be a factor of some importance. Both types of programs may, to a greater or lesser extent, be buttressed by positive preventive measures such as maintenance of a high level of employment and adjustment of income to family need, on the one hand, and the organization of community services, on the other.

These public provisions, taken together, make up the modern concept of social security. For convenience of discussion in this review, however, the term 'social security' is used in the more restricted sense of programs in which the emphasis is on economic assistance. The auxiliary welfare services and the social services generally are treated separately under welfare. General relief which, in Canada, varies from stable provincial-municipal public assistance to local relief for unemployed has also been included under welfare.

The major responsibility for public welfare in Canada rests traditionally with the provinces and it is only in recent years, as a result of the new concept of social security, that income-maintenance programs other than those for special groups have been introduced at the Federal level, e.g., Unemployment Insurance following amendment of the British North America Act, and Family Allowances. In 1944, the Department of National Health and Welfare was established to promote social welfare in matters over which the Federal Parliament has jurisdiction, except for services administered by other Federal Departments, such as the welfare of Indians and Eskimos and welfare services to veterans. Its duties include

the administration of the Family Allowances Act, the federal aspects of the Old Age Pensions Act, and of the National Physical Fitness Act.

Income-maintenance programs, reviewed in Section 1, include both Federal and Provincial Government schemes as well as the co-operative Federal-Provincial program for Old Age Pensions and Pensions for the Blind. Federal programs include Family Allowances, Unemployment Insurance, Prairie Farm Assistance, Veterans' Pensions and War Veterans' Allowances. A discussion of Federal Government Annuities has also been included because these annuities enable persons to provide economic security for their old age on a voluntary basis and because they are subsidized indirectly by the Federal Government. Provincial programs include Mothers' Allowances and Workmen's Compensation.

Federal and Provincial public welfare programs are reviewed in Section 2, together with a brief reference to the co-ordination through the Canadian Welfare Council of the supporting voluntary agencies which are typical of the Canadian pattern of social services. Within the framework of Provincial statutes, a substantial part of the responsibility for welfare is borne by Municipal Governments, with Provincial Governments playing an increasing role in co-ordination and supervision of services and in sharing of costs. These services may include any or all of the following: family welfare; provision for the protection and support of children when normal parental care breaks down or is destroyed; protection of unmarried mothers and their children; relief in cash or kind; guidance and counselling services; institutional care, or supervision of institutional care, of aged or other needy persons; medical care to needy persons; leisure time and recreation services; special services to youth; and maintenance of juvenile or other correctional institutions.

As the emphasis in public thinking is shifted to the welfare aspects of any given service, new programs are established or transferred to welfare authorities. This process of development is typified in Saskatchewan in the recent transfer of gaols and provincial institutions for correctional care to the Department of Social Welfare, and in Quebec by the extension of preventive and correctional care for delinquent youth under the Department of Social Welfare and Youth.

The social tensions of the war years made heavy demands on public and private social agencies. New methods of co-operative service were developed between different governmental levels and between public and private agencies. Through the Dependents Allowance Board and the Dependents Board of Trustees, which were charged with the payment of allowances to dependents of members of the Armed Forces, the Federal Government made extensive use of local resources. Cases requiring special investigation are referred to public and private organizations such as the Children's Aid Societies and family welfare agencies, on a fee basis. Where special enquiries are necessary, this type of procedure is also followed up by the Family Allowances Division of the Department of National Health and Welfare working largely through the provincial child welfare authorities. In this way close working relationships are maintained between the Federal and Provincial welfare authorities.

The wartime and postwar extension of services increased the demand for professionally trained social workers among Federal authorities and among an increasing number of Provincial and Municipal Departments of Welfare. Social workers are recruited chiefly from the Schools of Social Work established at the

Universities of British Columbia, Manitoba, Toronto, McGill, at the Roman Catholic Universities of Montreal and Laval, and from the Maritime School of Social Work in Halifax. In some of the Western provinces Welfare Departments provide in-training and refresher courses for staff members. Recognizing the urgent need of trained personnel, the Federal Department of National Health and Welfare has made substantial annual grants to the Canadian Schools of Social Work for training purposes.

Section 1.—Social Security

Subsection 1.—Federal Government Programs

Family Allowances.—The Family Allowances Act, 1944, was introduced as a basic social security measure designed to assist in providing equal opportunity for all Canadian children. Under the Act, allowances are payable in respect of every child in Canada below the age of sixteen years, who was born in this country, or has been resident here for three years, or has one parent who was domiciled in Canada for three years immediately prior to birth of the child.

The Allowances, which are paid out of the Consolidated Revenue Fund of Canada, involve no means test and are tax free. Payment is made monthly, and normally to the mother though any person who substantially maintains the child may be paid the Allowance on its behalf. The National Director of Family Allowances may order that payment be made to another person or agency if parental misuse occurs and the Allowances are not payable for any child who fails to comply with provincial school regulations. The Allowances are paid by cheque, except for Indian and Eskimo children of Yukon and the Northwest Territories, for whom payment is made in kind because of lack of exchange facilities and the urgent necessity of educating the natives in the use of nutritive foods which have generally been lacking in their children's diet. The Act provides that, if any person is dissatisfied with a decision as to his right to be paid the Allowances, or as to the amount of the Allowance paid to him, he may appeal the decision to a specially constituted tribunal. The Allowances are paid for the first four children in a family at the monthly rate of: \$5 for each child under 6 years; \$6 for each child from 6 to 9 years; \$7 for each child from 10 to 12 years; and \$8 for each child from 13 to 15 years. When there are five or more children in a family the Allowance for the fifth child is reduced by \$1, for the sixth and seventh children by \$2 each, and for any additional child by \$3.

¹ All figures except those in the last column refer to the month of March of the year indicated.

² Totals shown for year ended Mar. 31, 1946, cover 9 months only since payment of Family Allowances did not begin until July 1, 1945.

The program, which is administered by the Department of National Health and Welfare, is highly decentralized. Under the National Director of Family Allowances there is a Regional Director for each province and for Yukon and the Northwest Territories. A welfare section in each regional office deals with welfare questions arising out of administration of the Allowances. The Supervisor of Welfare Services in each regional office serves as adviser to the Regional Director and reports through him to the Chief Supervisor of Welfare Services, who acts in a similar capacity to the National Director. Actual preparation and issuing of the cheques is the responsibility of the treasury officer attached to each regional office who reports to the Chief Treasury Officer for the Department of National Health and Welfare.

Prior to 1947, Allowances were recovered from upper income group families through Income Tax, on a sliding scale adjusted so that full recovery was made from incomes of \$3,600 or over. As this recovery was discontinued by an amendment to the Income War Tax Act effective Jan. 1, 1947, Allowances are now paid in respect of virtually all children in Canada.

Unemployment Insurance.—In 1940, by an amendment to the British North America Act, the Federal Government was given complete jurisdiction in the field of unemployment insurance and since that time a national system of unemployment insurance administered by the Unemployment Insurance Commission has been in operation, as outlined in Chapter XVIII.

Veterans' Unemployment Assistance.—The Department of Veterans Affairs does not place veterans in employment, but works closely with the Department of Labour in connection with veterans' problems. Out-of-work benefits are authorized in certain cases as outlined in Chapter XXIX.

Prairie Farm Assistance.*—The Prairie Farm Assistance Act, passed in 1939, provides for direct money payments by the Federal Government, on an acreage basis, to farmers in areas of low crop yields in the Prairie Provinces and the Peace River District of British Columbia. The Act was designed to replace assistance in the form of relief and provides that payments be made to farmers under certain conditions and terms, and requires that 1 p.c. of the purchase price of all grains (wheat, oats, barley and rye) marketed in the Prairie Provinces be paid to the Federal Government and set aside in a special fund for the purposes of the Act.

If the farmer, who may be an owner or tenant, or a member of a co-operative farm association engaged in farming, is located in a crop-failure area, he may be awarded assistance on not more than one-half of the cultivated land or a maximum of two hundred acres.

During the eight crop years, 1939-46 inclusive, the total amount paid out under the Act was \$72,791,019; the amount collected under the 1 p.c. levy was \$26,384,114.

Veterans Pensions.—The Pension Act of 1919 established a Board consisting of three members vested with exclusive power and authority to adjudicate upon pension claims and to award pensions for disability or death related to military service in the War of 1914-18. Canadian pensions legislation as it developed following the First World War is outlined in pp. 759-760 of the 1943-44 Year Book, and as subsequently amended in Chapter XXX, pp. 1139-1143 of the 1947 Year Book.

Veterans Allowances.—In addition to war pensions, allowances are paid to certain non-pensionable veterans at 60 years of age, or earlier if the veteran is permanently unemployable or to eligible veterans who, having served in a theatre

* Contributed by G. S. H. Barton, C.M.G., B.S.A., D.Sc. A., Deputy Minister of Agriculture, Ottawa.

of actual war, are incapable and unlikely to become capable of maintaining themselves because of economic handicaps combined with disabilities. These allowances are outlined in Chapter XXIX.

Government Annuities.*—Under the Government Annuities Act (c. 7, R.S.C., 1927, amended by c. 33, 1931) passed in 1908, the Federal Government carries on a service to assist Canadians to make provision for old age, the Act being administered by the Minister of Labour.

The Canadian Government Annuity is a fixed yearly income purchased from and paid by the Government of Canada. The annuity is payable in quarterly (or other) instalments, for life, or for life and guaranteed for a period of years. The minimum annuity is \$10 and the maximum \$1,200 a year. Annuity contracts may be deferred or immediate. Under deferred annuity contracts purchase is by periodic or single premiums. Immediate annuity contracts provide immediate income.

The property and interest of the annuitant is neither transferable nor attachable. In the event of the death of the annuitant before a deferred annuity vests, all money paid is refunded to the purchaser or his legal representatives with interest. Provision is made in the Act for group annuity contracts, whereby employers may contract for the purchase of annuities on behalf of their employees, or associations on behalf of their members, the purchase money being derived partly from wages and partly from employer contributions. Group annuity plans now in effect cover a variety of industries and many municipal corporations throughout Canada. Many of the older members under group plans sold in recent years are now enjoying benefits under the Annuities Act.

From Sept. 1, 1908, the date of the inception of the system, up to Mar. 31, 1948, the total number of annuity contracts and certificates issued was 235,568. Of these, 24,633 have been cancelled (including 3,264 cancelled in 1947-48) leaving in effect on Mar. 31, 1948, 210,935 contracts and certificates. The total amount of purchase money received up to Mar. 31, 1948, was \$465,858,347.

Up to Mar. 31, 1948, 708 corporations, institutions and associations (as compared with 612 up to Mar. 31, 1947) had entered into agreements with the Government to purchase annuities. Under these agreements, as of Mar. 31, 1948, 92,063 employees or members were holding certificates for purchase of deferred annuities (as compared with 70,996 one year earlier). The number of certificates issued under groups in the year 1947-48 was 26,708 (as compared with 30,411 in the year 1946-47).

Table 4 gives details of the valuation for years ending Mar. 31, 1947 and 1948. A comparative analysis of the figures for these two years will show that the 1948 figures under "value of contracts in force" are somewhat low. The explanation is that during the latter year a punched card system was set up, under which the valuation age used was "age nearest birthday on March 31". This age was, on the average, a fraction of a year above that used under the earlier system which tended to reduce the reserve. The smaller transfer for the year 1948, seen under "Receipts" in Table 3, is a result of the same factor.

* Revised by the Government Annuities Branch, Department of Labour, Ottawa.

Up to June, 1940, annuity payments were, with certain exceptions, exempt from taxation under the Income War Tax Act. Under contracts issued after that date, income was fully taxable until the Act was amended in 1945. Under that amendment, the capital element in contractual annuities issued since June, 1940, was declared exempt from taxation, the portion representing interest being subject to tax as income. The change applies to income of 1945 and subsequent years.

Subsection 2.—Federal-Provincial Programs

Old Age Pensions and Pensions for the Blind.—Old Age Pensions, to be paid jointly by the Federal and Provincial Governments, were authorized by the Old Age Pensions Act, 1927, which became effective in the different provinces on the dates shown in Tables 5 and 6. Under the Act, British subjects aged 70 and over and not in receipt of an annual income exceeding \$365, who had resided in Canada for 20 years, and in the Province in which application was made for 5 years, immediately preceding the date of the proposed commencement of pension might qualify for a pension of up to \$240 annually. The Federal Government paid one-half the net cost of pensions until 1931, when the Government's share was increased to 75 p.c. In 1937, the Act was amended to provide pensions for blind persons aged 40 or over. By Order in Council the maximum pension was increased to \$300 in 1943, and the maximum income allowed to \$425 in 1944.

The Act was substantially revised in 1947 to permit an increase in the maximum pension, with liberalization of means and residence tests, elimination of the restriction of pension rights to British subjects, and reduction of the age at which a blind person is eligible for pension to 21 years. Under the amended Act the Federal Government contributes, in respect of each person in receipt of pension, a sum not exceeding 75 p.c. of \$30 monthly, or of the monthly amount paid by the province, whichever is less, so that, while the province may pay a higher maximum pension within the income limits fixed by the Act, the Federal contribution is payable only in respect of an amount of pension up to \$360 annually.

Old Age Pensions and Pensions for the Blind are not paid concurrently, or together with an allowance under the War Veterans Allowance Act, 1946, or to an Indian as defined by the Indian Act, and pensions for the blind are not paid with a pension for blindness under the Pension Act. To be eligible for assistance whether as a blind or as an aged person, under the amended Old Age Pensions Act, a person must have resided in Canada for 20 years immediately preceding date of proposed commencement of pension, or if absent from Canada in that time, must previously have resided in Canada for a period twice the period of absence. Old Age Pensions are payable to persons aged 70 or over when annual income, including pension, is

not more than \$600 for a single person or \$1,080 for a married person, or \$1,200 for a person married to a blind person. Pensions for the blind are payable to single blind persons aged 21 or over when annual income, including pension, is not more than \$720 for a single person, or \$920 if there is a dependent child or, in the case of married persons, if the total income of the couple, including pension, is not more than \$1,200, or \$1,320 if both are blind.

Pensions are paid by the provinces, with Federal Government reimbursement being made through the Department of National Health and Welfare.

Since 1942, certain provinces have paid supplemental allowances in addition to the pension. These allowances, and the conditions under which they are paid, have varied from time to time. At Mar. 31, 1948, the following rates were in effect: In British Columbia \$10; in Ontario up to \$10; in Alberta \$5; in Nova Scotia up to \$5. As from Apr. 1, 1948, Saskatchewan paid a supplemental allowance of up to \$5 and the allowance in Alberta was increased to \$7.

Subsection 3.—Provincial Programs

Mothers' Allowances.—All provinces, except Prince Edward Island, provide for allowances to mothers who are widowed or who, for other reasons, are without means of support. Manitoba was the first to enact such legislation in 1916. Five other provinces followed between 1917 and 1920. The Nova Scotia and Quebec Acts came into effect in 1930 and 1938, respectively. A New Brunswick Statute of 1930, proclaimed in 1943, was replaced by a new Act in 1944.

Except in Alberta, where 25 p.c. of an allowance is borne by the municipality, the whole cost is provided from provincial funds. In Quebec, not more than 5 p.c. of the amount of the allowances paid may be imposed on municipalities, but no levy has been made under this provision.

Each Act stipulates that an applicant must be a resident of the Province and, except in Alberta, have resided there for a certain period. Alberta merely requires that the husband should have had his home in the Province at the time of his death, committal to an institution or desertion of his wife.

Except in Saskatchewan and Alberta, nationality is an important condition of eligibility. In Quebec, the mother must possess Canadian citizenship by birth or have been a Canadian citizen for 15 years, or she must be the widow or the wife of such a Canadian citizen. In the remaining provinces, the applicant must be a British subject or the widow or wife of a British subject or her child must be a British subject. In Nova Scotia, the applicant herself must be a British subject, and in New Brunswick and Manitoba the child is eligible if he is a British subject, even if the mother is not. In British Columbia, a woman may be eligible if she is or was a British subject by birth or naturalization.

An applicant must be a widow, or a wife whose husband is mentally incapacitated or, except in Alberta, totally and permanently disabled. In some provinces mental disability means confinement in a provincial mental hospital. A permanent physical disability is also variously defined. The British Columbia and Quebec Acts, for example, specify a physical disability which may reasonably be expected to continue for at least one year; Saskatchewan for a period of nine months or more. In New Brunswick, Nova Scotia and Saskatchewan, a mother is declared eligible if her husband is confined to a sanatorium for tuberculosis. In New Brunswick, the allowance may be continued if the parent in respect of whom the allowance is being paid is discharged from a sanatorium and following treatment at home. In Nova Scotia, an allowance may be paid regardless of whether the husband is in an institution or receiving treatment at home. In Saskatchewan, when the mother is deceased or in a mental institution or sanatorium, the allowance may be paid to the father if he is incapacitated and living at home with the children. Foster mothers caring for children whose parents are dead or disabled are also eligible, except in Nova Scotia and Alberta.

Deserted wives who meet specified conditions are eligible, except in Nova Scotia, but the period that must elapse after desertion varies from province to province. Mothers who have been divorced or legally separated from their husbands for two years are eligible in British Columbia, and a mother who is divorced may be paid an allowance in Saskatchewan. In British Columbia and Saskatchewan, the wives of inmates of penal institutions are eligible.

In Nova Scotia, New Brunswick, Saskatchewan, Manitoba and Quebec, allowances may be paid in respect of a legally adopted child. In Manitoba, Saskatchewan, Alberta and British Columbia, allowances are paid, in some cases, for children born out of wedlock.

Mothers of one or more children are eligible except in Nova Scotia, where the mother of one dependent child is eligible only if she is incapacitated, if she has residing with her a husband permanently disabled or if the welfare of the one child requires it.

The age-limit for children is 16, except in Manitoba where it is 15, or over 15 if the child is physically or mentally incapacitated. On certain conditions, allowances may be paid in British Columbia for a child between 16 and 18 years or for a child living temporarily apart from its mother. The Alberta Act permits payment to children between 16 and 18 years if satisfactory progress is being made at school. In New Brunswick, when a child reaches 16 years and is attending school, payments may be continued until the school year ends; no allowance may be paid for a child not attending school as required by law. In Quebec, when a child reaches 16 years and is attending school, payments may continue until the end of the school year and, if the child is unable to work on account of mental or physical incapability, an allowance is paid until he reaches the age of 19. Under the Quebec Act, also, an allowance may be paid with the authorization of the Lieutenant-Governor in Council in any special case of a needy mother which is not specifically provided for in the Act. In most of the other provinces, cases of this kind would taken care of under social assistance or relief.

The most recent Alberta amendment permits the payment of allowances to persons now residing in other provinces, providing reciprocal agreements are in effect with such other provinces.

Rates of Allowances.—In Nova Scotia, a maximum of \$80 per month per family and in New Brunswick \$60 is fixed by Statute, but in other provinces the administrative authority fixes the rate. In Nova Scotia, the monthly amount payable to a mother and one child is determined by family need. In New Brunswick the maximum monthly amount for a mother with one child is \$27.50 and \$7.50 for each additional child with a family maximum of \$60. An extra \$7.50 may be paid for rental under special circumstances. Quebec allows \$35 monthly to a woman with one dependent child in cities and towns of over 5,000 population, \$30 in other localities. An additional \$1.00 per month is paid for each of the second, third, fourth and fifth children, \$2 each for the sixth and seventh and \$3 for the eighth and subsequent children. An extra \$5 is allowed when the beneficiary is unable to work, or when a disabled husband is living at home. In Ontario, the maximum for a mother and one child is \$42 per month with \$6 for each additional child.* The Allowance may be increased by \$10 per month per beneficiary where need is evidenced; a winter fuel allowance is also paid according to need. The maximum monthly amount in Manitoba paid to a mother and one enrolled child, excluding winter fuel, is \$40 with additional allowances for other children; a disabled father in the home receives \$13 maximum, monthly. The Allowance may be augmented up to \$25 where special need is shown but the monthly maximum, excluding winter fuel, to any family with or without father at home is \$121. In Saskatchewan, the maximum yearly Allowance payable for a mother and one child is \$300; mother and two children \$420; mother and three children \$480, rising to \$900 for a mother and ten children. The Allowance in Alberta does not exceed \$35 per month for a mother with one child and may rise to a maximum of \$100 where there are nine

* Since the above was written the Ontario Allowance for a mother and one child was increased to a maximum of \$50 per month with \$10 per month for each additional child (May 5, 1948. O. Reg. 77/48).

children or more. In British Columbia, the maximum monthly Allowance is \$42.50 for a mother with one dependent child, \$7.50 for each additional child and a further \$7.50 for a totally disabled husband living at home.

The following table gives statistics for the individual provinces providing Mothers' Allowances.

Workmen's Compensation.—In all provinces, except Prince Edward Island, legislation is in force providing for compensation for injury to a workman by accident arising out of and in the course of employment, or by a specified industrial disease. Summary of provincial legislation is given in Chapter XVIII.

Section 2.—Welfare

Subsection 1.—Federal Government Welfare Services

The National Physical Fitness Program.—The building of an integrated nation-wide physical fitness program was commenced with the passing of the National Physical Fitness Act of 1943. Planned as a basic social measure to improve the physical and mental fitness, and the cultural and social development of the Canadian people, the program is designed primarily to stimulate and assist spontaneous local growth in the community, with government participation being devoted principally to the initiation and provision of services to foster this growth. The National Physical Fitness Act serves as a stimulus to the program in two ways.

Under the Act, Parliament makes available to the Provinces, and to Yukon and the Northwest Territories, through the National Physical Fitness Fund, a sum not exceeding \$225,000 annually, distributed on a per capita basis among those provinces which have signed agreements with the Federal Government to support a program of physical fitness and recreational development as provided in the Act. The maximum amount available for the annual grant to each province is: Prince Edward Island, \$1,858.50; Nova Scotia, \$11,301.75; New Brunswick, \$8,943.75; Quebec, \$65,151.00; Ontario, \$74,063.25; Manitoba, \$14,269.50; Saskatchewan, \$17,520.75; Alberta, \$15,567.75; British Columbia, \$15,993.00; Yukon, \$96.75; and Northwest Territories, \$234.00. At the present time the Maritime and Prairie Provinces, British Columbia and the Northwest Territories participate in the scheme.

The Act also authorized the establishment of the National Council on Physical Fitness, which is composed of not fewer than three or more than ten members appointed by the Governor in Council. The Council, which meets at least semi-annually, acts in an advisory capacity to the Minister of National Health and Welfare and provides an effective liaison between the different levels of government and with the voluntary organizations interested in fitness and recreation. Each province participating in the national program has established its own advisory body.

The National Amateur Athletic Achievement Award, a medal for outstanding achievement in the sphere of amateur athletics in Canada, is presented from time to time by the National Council, the winner being selected by the Award Committee which is composed of representatives of leading Canadian organizations devoted to the advancement of amateur sport and cultural interests. Barbara Ann Scott, of Ottawa, Ont., World and Olympic Champion Figure Skater, was the first winner, in 1947.

Federal administration of the program is carried on by the Physical Fitness Division of the Department of National Health and Welfare which, in addition to administering the grants to the provinces, performs the administrative duties of the National Council on Physical Fitness, co-operates with other Federal Departments and with the national agencies and organizations, collects and distributes information originating in this and other countries, interprets the national program of fitness through publications and reports, and is concerned with the conduct of research, experiments and demonstrations. This Division maintains a preview film library, the material for which is selected from all available sources by committees of experts in physical fitness and recreational fields. Films recommended by these committees are purchased and circulated to the provinces on a "preview with a

view to purchase" basis. Other activities have included: production of a series of films, two of which have been released, "Fit for Tomorrow" and another on urban recreation; assistance to universities in the establishment of degree courses in health, physical education and recreation; and co-operation on the production of a film strip illustrating the use of the Wetzel Grid, a graph recently evolved for the evaluation of the physique, the growth, the physical progress and the caloric need of a child.

Provincial Administration.—The physical fitness program is administered provincially by the Department of Education in Prince Edward Island, New Brunswick, Alberta, Saskatchewan and British Columbia; by the Department of Public Health in Nova Scotia and by the Department of Health and Public Welfare in Manitoba. Saskatchewan and Manitoba have passed their own Physical Fitness Acts. The actual carrying out of fitness and recreation projects is a provincial and local responsibility and the provincial program is organized with a view to strengthening and aiding the community, and all agencies active in this field. The underlying principles are: the development of a program of fitness in relation to the needs and determined priorities of the province; the development of both volunteer and paid leadership through the conduct of training courses and in some instances the payment of salaries; co-ordination and extension of existing agencies, with the initiation of programs originated only where there are no available agencies to undertake them; and in certain provinces the provision of financial aid to local programs approved by the province.

Community activities are necessarily varied. The National Council on Physical Fitness has defined the primary responsibility of the community as the duty of making recreational facilities available at all times to all classes and age groups through the provision of leadership, planning, financial support, supervisory staff and equipment; of ensuring co-operation amongst different groups and with other communities; and the provision of that essential element of personal interest and enthusiasm without which the program cannot succeed.

Veterans' Welfare Services

Welfare and rehabilitation services for Veterans, as administered by the Department of Veterans Affairs, are outlined in Chapter XXIX.

Welfare Services for the Indian and Eskimo

Welfare Services for the Indian and Eskimo, as administered respectively by the Indian Affairs Branch and the Bureau of Northwest Territories and Yukon Affairs of the Department of Mines and Resources are outlined in Chapter XXX.

Subsection 2.—Provincial Welfare Services

Prince Edward Island.—Public welfare services are administered by the Department of Health and Welfare. These include child welfare, direct relief payments, and supervision of the Infirmary for the care of the aged and infirm. Two orphanages, one Protestant and one Roman Catholic, are operated as private institutions. Two Children's Aid Societies operate under authority of the Children's Act.

With the exception of the city of Charlottetown and seven incorporated towns, the Province is organized as a single welfare unit, with no geographical or political division into municipalities.

Nova Scotia.—Public welfare services are administered by the Department of Public Welfare.

Child Welfare and Protection.—The Child and Family Welfare Branch is responsible for the administration of the Adoption Act; the Nova Scotia Training School for mentally defective children; the Nova Scotia School for Boys for delinquent boys; assistance to and supervision of the 12 Children's Aid Societies and, in unorganized districts, carrying out the duties normally delegated to the Societies; inspection of all child-caring institutions and reformatories; and operation of six juvenile courts and supervision of their probationary staff.

Wards of the Children's Aid Societies are placed in foster homes when possible, or in child-caring institutions. Forty per cent of maintenance up to \$5 per week is borne by the Province with the municipality paying the remainder and the Province paying an extra \$2 to \$7 at the discretion of the Minister. Financial provision for children in private reformatories is at the rate of \$75 per annum from the municipality, and \$275 from the Province. For children in the Nova Scotia School for Boys and in the Nova Scotia Training School the municipality pays \$175 and \$200 respectively, all other expenses being borne by the Province.

Care of the Aged.—Homes for the Aged are operated by municipalities and religious and private bodies under provincial inspection with no provincial or Federal support other than the Old Age Pension described in Subsection 2 of Section 1. Old age pensioners boarding in these homes may pay their pensions directly to the institution or, if the pensioner is incapable of managing his own affairs, the pension may be paid to the institution by the Department.

New Brunswick.—Public welfare services are administered by the Department of Health and Social Services.

Child Welfare and Protection.—The Department administers the Children's Protection Act and the Adoption Act, through the Child Welfare Division. Seventeen Children's Aid Societies are operated, one for each county and one each for the cities of Moncton and Fredericton. Orphanages are under the auspices of religious, private or, in certain cases, municipal bodies. All child-caring institutions are subject to provincial inspection with one-half the cost of maintenance paid by the Province. Reformatory institutions for children are reimbursed at the rate of \$200 per annum for each child by the Province, and an equal amount by the municipality.

Care of the Aged.—Homes for the Aged are operated under municipal, religious, fraternal and private auspices and are subject to provincial inspection, but receive no provincial financial support.

Quebec.—Public welfare services are administered by the Department of Social Welfare and Youth, which was established in 1946 in recognition of the importance of stressing and combining all aspects not only of social welfare but of aid and counsel to youth. Administrative policy differs somewhat from that in other provinces as responsibilities ordinarily assumed by other provincial authorities are, in many cases, delegated to recognized religious and private welfare agencies, which are aided by substantial grants from public funds.

In addition to administering old age pensions, pensions for the blind, pensions to needy mothers and grants to public charities the Department is charged with the rehabilitation of youthful delinquents and the prevention of juvenile delinquency.

Preventive work is carried out by the Family Registry Office, whereby children from tubercular families, who have not been infected but for whom there is reason to be apprehensive, are boarded out with rural families. The office, in conjunction with local clergy and doctors, maintains supervision over the moral and physical condition of these children.

Another aspect of the welfare program is the colonization scheme, whereby needy families are settled on the land in newly opened districts, and are supervised and granted financial aid until they become self-supporting.

The Department is responsible also for a number of education services not usually included in a welfare department, i.e., some fifty specialized training schools, correspondence courses and scholarship grants.

Ontario.—Public welfare services are administered by the Department of Public Welfare.

Child Welfare and Protection.—The Children's Aid Branch of the Child Welfare Division is responsible for the administration of the Children's Protection Act, the Children of Unmarried Parents Act and the Adoption Act, and for supervision of the 53 Children's Aid Societies and all institutions for children in the Province. Maintenance of wards is borne in full by the municipality of residence.

The Day Nurseries Branch of the Division administers the Act respecting Day Nurseries of 1946, which provides for the establishment of day nurseries in Ontario. Under the Act, any municipality establishing a day nursery may receive a provincial contribution equal to one-half its expenditures on operation and maintenance. The Act also provides for the supervision of all day nurseries throughout Ontario.

The British Child Guests Branch continues the supervision of British children evacuated from the United Kingdom during the Second World War who still remain in Ontario.

Since the Second World War the Children's Aid Branch has co-operated with Federal Department of Veterans Affairs in assisting in the re-establishment of returned veterans, and in family welfare problems.

Care of the Aged.—Homes for the Aged are operated under provincial supervision by counties, cities, districts and religious or benevolent societies. In 1947, two new Acts: The Homes for the Aged Act and The District Homes for the Aged Act, replaced The Houses of Refuge Act and The District Houses of Refuge Act, under which, with the Charitable Institutions Act, all Homes for the Aged are incorporated. The new Acts provide for payment by the Province of 25 p.c. of the cost of construction of new buildings or of alterations to provide additional accommodation, after plans have been approved by the Minister of Public Welfare. The Province, under an agreement with the Ontario Medical Association, provides limited medical services to old age pensioners.

Unemployment Relief.—Regulations under the Unemployment Relief Act authorize contribution on the part of the Department of Public Welfare toward the alleviation of distress of unemployable persons. Schedules of assistance are provided in the regulations and are adjusted from time to time in accordance with changing food prices. An upward adjustment of 15 p.c. was made in food allowance in 1947. Municipalities are reimbursed 50 p.c. of their expenditure, while in the unorganized areas the Province administers and pays the total cost of aid rendered.

Assistance to Veterans.—Through the Soldiers' Aid Commission, advice and emergency assistance is extended to ex-service men of the First and Second World Wars and to their families.

Manitoba.—Public welfare services are administered by the Public Welfare Division of the Department of Health and Public Welfare. They include case-work services throughout the Province, social assistance or general relief in unorganized areas of the Province, and financial responsibility for assistance to non-resident transients.

Child Welfare and Protection.—In most of the municipally organized territory, child-care and protection services are administered by four non-denominational Children's Aid Societies, which are paid by the Province to provide basic child protection. Maintenance of wards is financed by the municipality of residence. Children's services in other areas are provided directly by the Public Welfare Division.

Welfare Services.—Homes are found and supervision is provided for mental defectives placed under the custodianship of the Director of the Public Welfare Division. The Broadway Home in Winnipeg, an advanced training school for mentally defective girls, comes under the joint direction of the Divisions of Public Welfare and Psychiatry.

Saskatchewan.—Public welfare services are administered by the Department of Social Welfare.

The Department is divided into four main branches, Child Welfare, Old Age Pensions, Social Aid, and Corrections; it operates the Home for the Aged and Infirm, and the Regina Nursing Home. The Social Welfare Board which was constituted by the Social Welfare Act, 1945, consists of the Deputy Minister as Chairman, and the Directors of the four major branches; it supervises the granting of all forms of assistance provided by the Department and acts in an advisory capacity to the Minister of Social Welfare.

Child Welfare and Protection.—The Child Welfare Act and the Education of Blind and Deaf Children Act are administered by the Child Welfare Branch and involve supervision of all child welfare services in the Province. When possible, children are placed in foster homes, with older children being placed in some cases on farms under wage agreements. The Branch operates five child-caring institutions for the care of wards until they can be returned to the care of their parents or placed in foster or adoption homes. A portion of the maintenance costs for all wards, other than those born out of wedlock, where an attempt is made to recover from the father, is borne by the municipality. Financial responsibility, however, is limited so that it will not exceed one mill of the municipality's tax rate, and ceases when the child reaches 16 years of age. All recipients of Mothers' Allowance and dependents on behalf of whom the Allowance is paid are provided with free medical, dental, optical and hospital care and free drugs.

Care of the Aged and Infirm.—The Department operates a Home for Aged and Infirm Persons which provides accommodation for 109 persons. During 1947, a second Home was opened to accommodate 75 aged and infirm patients. Plans are underway for an additional Home to be operated by the Department where accommodation will be provided for another 150 to 200 persons. The Social Welfare Act also provides for the licensing and supervision of privately operated homes. Old age and blind pensioners and their dependents are provided with free medical, dental, optical and hospital care.

Social Assistance.—The needs of indigent persons are provided by the Social Aid Branch in co-operation with the various municipal units of the Province with the Province contributing 50 p.c. of the cost of food, clothing and shelter furnished by municipalities to needy municipal residents, employable and unemployable. Assistance is provided to transient indigents and the entire cost is borne by the Province. The Branch operates a farm where the Métis—persons of mixed Indian and White blood who do not qualify under the Indian Act—are instructed in modern methods of farming while being paid for their work, and two schools for Métis children. A Division of the Branch provides training and placement services for handicapped and crippled persons, selected on the basis of aptitude tests; one-half the cost of this training is borne by the Province, the other by the municipality. The Branch also administers Mothers' Allowances.

Correctional Services.—On Apr. 1, 1947, responsibility for administration of the provincial gaols was transferred to the Department. The Corrections Branch was established to include the Industrial School for Boys, the four Provincial Penal Institutions, and Probation Services. A general revision of provincial correctional services is planned to provide for better segregation and for more adequate vocational training and social case work in an effort to rehabilitate prisoners on their discharge from gaol.

Alberta.—Public welfare measures are administered by the Department of Public Welfare.

Child Welfare and Protection.—Care of children who become wards of the Province by neglect, delinquency or indenture and agreement comes under the exclusive control of the Child Welfare Commission. Children may be placed in foster homes, in paid boarding homes or in institutions depending on the individual circumstances. Reform schools for delinquent children are not maintained; such children are placed in private family homes under supervision and inspection by the Home Investigating Committee of the Department. The maintenance of children who are made wards of the Province, and for whom a maintenance order has been issued by the Court is borne by the municipality of residence.

Care of the Aged and Infirm.—The Home for Aged or Infirm Act of 1945 provides for the payment of grants to municipalities maintaining either an aged or infirm resident in a licensed home.

Through the Poliomyelitis Sufferers' Act, provision has been made for the re-establishment of persons incapacitated because of poliomyelitis.

The cost of providing hospital and medical services for old age pensioners, blind pensioners and recipients of Mothers' Allowances and their dependents is now being borne by the Provincial Government through the Department of Public Health.

Maternal Welfare.—The Maternal Welfare Act provides for a grant of up to \$15 to needy mothers prior to or immediately following the birth of child.

Social Assistance.—The Family Division of the Bureau of Public Welfare Branch provides full cost of assistance to indigent families who have no municipal residence or who are resident in unorganized districts. Services include medical and hospital services for the indigent sick. Grants of up to 80 p.c. of the cost are made to municipalities providing this assistance to their unemployable residents. The Single Men's Division maintains four hostels, one each at Edmonton and

Calgary and two in rural areas, to care for destitute single homeless men without permanent municipal domicile. Single ex-service men are cared for in Calgary and Edmonton without being institutionalized. The Province assumes the cost of these projects. The Bureau has been successful in the rehabilitation of families by settling them on suitable farm lands.

Métis Rehabilitation.—The rehabilitation of the Métis—persons of mixed Indian and White blood who do not qualify under the Indian Act—is the responsibility of the Métis Rehabilitation Branch and has been carried out by the setting aside of tracts of land as Métis Settlement Areas, where settlers have exclusive fishing, hunting and trapping rights and where they are encouraged to engage in lumbering, agriculture and stock-raising. Educational and social services are provided and Government-operated stores sell goods at cost price.

British Columbia.—Public welfare services are administered by the Social Welfare Branch of the Department of Health and Welfare.

Organization and Field Service.—The Province is divided for administrative purposes into five Regions with 23 District Offices. In 1947, decentralized administration and supervision was achieved, allowing for regional payment of social allowances and professional supervision of the staff. A generalized field service covering all categories is given by provincial social workers in the territory to which each is assigned.

The Social Assistance Act makes it mandatory for cities and municipalities of over 10,000 population, to have their own Social Welfare Departments, to administer the Social Assistance Act and to give case work services to old age pensioners and Mothers' Allowance recipients. The Province also pays 50 p.c. of the salaries of municipal social workers, or where more than one is needed, matches the municipal appointees, worker for worker. Smaller municipalities may either have their own Social Welfare Departments or pay the Province 15 cents per capita each year for the services of the Social Welfare Branch. There are four municipalities with only one social worker, nine with amalgamated staff, the remainder choosing the 15 cents per capita alternative.

The Province reimburses the municipalities 80 p.c. of the costs of all forms of social assistance granted to those in need, with the exception of Old Age and Blind Pensions and Mothers' Allowances for which the municipalities do not contribute. Medical or boarding-home costs over and above the pension or allowance are shared on an 80-20 provincial-municipal basis.

Child Welfare and Protection.—The administration of the Protection of Children Act, the Adoption Act, the Children of Unmarried Parents Act, and the placement of children in foster homes is carried on by the Child Welfare Division, except in Vancouver and Victoria where Children's Aid Societies are located.

Care of the Aged.—A provincial home is operated for the care of aged male persons. Several cities and municipalities also operate homes for the aged, receiving grants from the Province for costs of construction of homes. Case work and medical services are provided for pensioners.

Social Assistance.—The Family Division administers the Mothers' Allowance Act, and the Social Assistance Act which provides for the granting of Social Allowances to individuals or families, counselling services to families when financial aid is not required, health services, occupational training or re-training, and boarding and foster home care.

Medical Services.—The Medical Services Division is responsible for the payment of medical expenses over and above those ordinarily provided. All cases under any of the above categories of service are provided with a medical card which entitles them to obtain the services of the doctor of their choice, medicines as prescribed and hospital treatment when necessary. Since 1947, a grant of \$3 per day, in addition to the per diem per capita rate paid for all patients, is given to hospitals for the treatment of social welfare cases.

Special Services.—Certain divisions of the Health Branch of the Department of Health and Welfare include social services as part of their treatment. Social workers appointed by the Social Welfare Branch give medical social work services in the Tuberculosis Sanatoria and Venereal Diseases Clinics with services also being provided for the families of patients. Provincial institutions and hospitals have social service programs as a part of their treatment and case work services are provided in the Provincial Mental Hospital and child guide clinics. Infirmary applications and a hospital clearance program are carried out by the field staff under the supervision of the Inspector of Hospitals, with the advice of the Social Welfare Branch personnel.

Federal Departments use the services of the Branch co-operatively in connection with social investigations they may wish to have made in any part of the Province.

Correctional Services.—Administration of the Boys' and Girls' Industrial Schools, family case work and rehabilitative follow up of all boys and girls treated at the schools is carried on in co-operation with the Juvenile Courts.

Institutional Care of Dependent and Handicapped.*—Detailed statistics of charitable and benevolent institutions in Canada are made available quinquennially and, as reported for the 1941 Census, appear at pp. 677-682 of the 1943-44 Year Book. Table 1 below, gives figures as of June 1, 1946.

* Prepared under the direction of J. T. Marshall, Acting Director, Vital Statistics Division, Dominion Bureau of Statistics, by J. C. Brady, Chief, Institutions Statistics.

Subsection 3.—Voluntary Services—Co-ordination at the National Level

The Canadian Welfare Council.—This Council, established in 1920, is a national association of public and private agencies in partnership to secure comprehensive well-administered social services of high quality for the Canadian people. It furnishes authoritative information, technical advice and field service to public and private agencies in the main areas of social welfare, and publicizes social needs by focussing attention on specific social ills and encouraging citizens to help remedy them. It provides a means of co-operative planning and action, by serving as a link between the public and private agencies whose team work is essential to sound welfare services.

The policies and program of the Council are determined by its members, with the help of a nationally representative elected Board of Governors. Aided by a professional staff which provides both central office and field service, members work together in these Divisions: Child Welfare, Family Welfare, Recreation, Delinquency and Crime, Public Welfare, French-Speaking Services, Surveys and Research, Community Chests and Councils, Volunteer Services, and Youth Services. Membership is open to individuals and agencies interested in social welfare, whether or not they are professionally engaged in its practice.

The Council has a broad basis of support. Community Chest grants and assessments provide 34 p.c. of the annual budget, donations 23 p.c., Federal and Provincial Government grants 21 p.c., payments for special services 10 p.c., memberships 9 p.c. and miscellaneous activities 3 p.c.

The Council's magazine *Canadian Welfare*, which commenced publication in 1924, is issued eight times a year. To provide information regarding the latest trends and programs in public and private welfare services, recreation and community organization, and a general survey of developing social services in Canada and abroad, pamphlets on a wide range of welfare subjects are prepared and supplied at small cost to member agencies and interested individuals, and a Directory of Welfare Services is issued and revised at regular intervals. A library on welfare subjects is available to members, and books and pamphlets may be borrowed. An information and consultation service by mail is also provided.

Some subjects in which the Council has been interested since its inception have been the regulation of child labour, adequate controls for juvenile immigration, assistance to Municipal and Provincial Governments in setting up relief administration, a study of Canadian adoption laws as a step towards uniform and high standards of adoption procedure in all provinces, the planning for the reception and placement of war guests, briefs on Dominion-Provincial relations, Indian affairs, and housing, and a large number of surveys on a variety of subjects, requested by agencies, communities and provinces.

Canadian Criminal Law and Procedure.—A review of the development of the Criminal Code in Canada is given at pp. 1085-1087 of the 1934-35 edition of the Year Book; it includes a résumé of procedure and an account of the jurisdiction of the various classes of judges and magistrates.

The statistics presented in this Chapter are summarized from the "Annual Report of Statistics of Criminal and Other Offences", and are collected directly from the criminal courts in the different judicial districts throughout the Dominion. There are 148 judicial districts, including 2 sub-districts, divided by provinces as follows: Prince Edward Island 3, Nova Scotia 7†, New Brunswick 15, Quebec 26, Ontario 48, Manitoba 6, Saskatchewan 21, Alberta 12, British Columbia 8, Yukon 1, and the Northwest Territories 1.

Crime is divided into two definite classes, criminal or 'indictable' offences, which include all serious crimes covered by the Criminal Code (see pp. 277-278), and summary or 'non-indictable' offences, which comprise less serious crimes and breaches of municipal by-laws (see p. 283). Indictable offences consist of all cases proceeded against by the higher Courts of Justice—those triable before a Supreme Court Judge with jury and those triable by Judges under the Speedy Trials Act and Summary Trials⁷ Act. The most serious crimes, such as murder, manslaughter, robbery with violence, etc., are triable by a Supreme Court Judge with jury, without election of the accused. Lesser indictable offences are tried by County Judges with a jury, or "Speedy Trial" (trial by Judge without jury, by election of the accused). Non-indictable offences, breaches of municipal by-laws, traffic laws, etc., are usually dealt with summarily by Police Magistrates or other Justices and Recorders under the Summary Convictions Act.

* Except as otherwise indicated, this Chapter has been revised under the direction of J. T. Marshall, Acting Director, Health and Welfare Division, Dominion Bureau of Statistics, by Miss R. Harvey, Chief, Criminal Statistics Section. The 71st "Annual Report of Statistics of Criminal and Other Offences", for the year ended Sept. 30, 1946, is obtainable from the Dominion Bureau of Statistics, Price 50 cents.

† The 18 counties in Nova Scotia previously listed are grouped into seven Judicial Districts.

PART I.—CRIME OF ADULTS*

Section 1.—Total Offences

After the First World War, there was a gradual increase in crime. There is some reason to believe that a similar trend is in evidence to-day.

During 1946 there were 713,631 cases of adult offenders handled by the courts as compared with 504,181 cases in 1945. Of this total 53,959 charges were of an indictable nature while 659,672 were non-indictable. The corresponding figures for 1945 were 48,263 for indictable and 455,918 for non-indictable crimes. The total convictions in 1946 numbered 706,611 an increase of 41·9 p.c. over 1945.

* Persons 16 years of age or over.

ADULT CONVICTIONS PER 100,000 POPULATION

	Post-War Period	Indictable	Non-indictable	Total
<i>First World War—</i>				
1917.....		193	1,221	1,414
1918.....		213	1,300	1,513
1919.....		222	1,343	1,565
1920.....		215	1,684	1,899
1921.....		221	1,795	2,016
<i>Second World War—</i>				
1944.....		355	3,597	3,952
1945.....		346	3,762	4,108
1946.....		381	5,360	5,741

ADULT CONVICTIONS PER 100,000 POPULATION
FOR

Ontario led the provinces in total convictions per 100,000 estimated population during 1946, with a ratio of 9,157. Manitoba, with 5,344, changed places with Quebec for second place as compared with 1945; Quebec had 5,112. Figures for the other provinces were: British Columbia, 3,601; Prince Edward Island, 3,229; New Brunswick, 3,212; Yukon and the Northwest Territories, 2,525; Nova Scotia, 2,480; Alberta, 2,468; and Saskatchewan 1,979. Saskatchewan has held the most favourable position among the provinces since 1943.

1.—Total Convictions of Adults, Classified by Indictable and Non-Indictable Offences, Years Ended Sept. 30, 1942-46

NOTE.—Classification of indictable crimes is given in Table 3, p. 277, and of non-indictable crimes in Table 13, p. 283.

Class of Offence	TOTAL NUMBER OF CONVICTIONS									
	1942		1943		1944		1945		1946	
Indictable offences.....	39,309		41,752		42,511		41,965		46,939

Subsection 1.—Indictable Offences

People interested in crime are mainly concerned with the more serious offences. While such offences are by far the least numerous, nevertheless from the standpoint of protection of the person and of property, they are the most important. In the study of crime statistics it is desirable to have comparable figures over a period of years. Table 2, along with figures published in earlier editions of the Year Book, provides the necessary background.

In 1936 the total number of convictions for indictable crimes was 36,059; in 1946 it had increased to 46,939 or by 30.2 p.c. The increase in the population during the same period was 12.4 p.c.

2.—Convictions for Indictable Offences, by Provinces, Years Ended Sept. 30, 1937-46

NOTE.—Figures for 1900-20 are given at p. 1016 of the 1933 Year Book, for 1921-30 at p. 908 of the 1942 edition and for 1931-36 at p. 1108 of the 1946 edition.

Convictions in all six classes into which indictable crimes are divided for statistical purposes increased in 1946 over 1945. Crimes against the person increased by 25.6 p.c., malicious damage to property by 23.6 p.c. and forgery and uttering by 63.0 p.c. This last high increase was due to some extent to multiple convictions. Of the 610 persons convicted of forgery and uttering, 270 had an average of just under four convictions each.

Convictions for assaults of various kinds were up by 24.6 p.c. and manslaughter and murder by 47.5 p.c. Among the provinces, the highest increases for murder and manslaughter were shown in Quebec for manslaughter (10 cases in 1945 and 16 in 1946), in Ontario for both murder and manslaughter (8 cases of murder in 1945 and 13 in 1946, and 14 cases of manslaughter in 1945 as compared with 24 in 1946, 8 of which were originally murder charges), and in Alberta for murder (1 case in 1945 and 9 in 1946). The Alberta convictions included 5 against German prisoners of war for the murder of a fellow prisoner. Shooting and wounding increased by 54.8 p.c., the highest increases for this offence being in Ontario, Saskatchewan and Alberta.

Convictions for arson increased by 80.4 p.c. in 1946 over 1945 and dangerous and reckless driving by 119.3 p.c.

Theft, robbery and burglary (house- and shop-breaking) and assault (aggravated and common) accounted for 51.8 p.c. of the convictions for indictable offences in 1946. Theft, including theft of automobiles, comprised 26.7 p.c.

Analyses of Convictions for Indictable Offences.—Table 4 shows that at least 76.8 p.c. of those convicted of indictable crimes in 1946 had not gone beyond elementary school grades; that 23.4 p.c. of the crimes were committed by youths between the ages of 16 and 21 years; that approximately 82 p.c. of those convicted were dwellers in urban districts; and that approximately 10 p.c. were born outside Canada.

Convictions of Females.—Although the number of convictions against men has increased considerably since 1942, those against women have dropped to 3,168, just over one-half of the 1943 figure. Decreases were shown in all provinces except Ontario, Manitoba and Saskatchewan, and in Yukon and the Northwest Territories.

5.—Convictions of Females for Indictable Offences, by Provinces, Years Ended Sept. 30, 1942-46

Province or Territory	Numbers of Convictions					Percentages of Females Convicted to Totals Convicted

Multiple Convictions.—The total number of convictions for any one year must not be confused with the total number of persons convicted for the same period since persons tried for indictable offences are in many cases convicted for more than one offence at the same trial. The trend of such multiple convictions is of value to students of sociology.

6.—Persons Convicted of More than One Offence at the Time of Trial Compared with Persons Convicted of One Offence, Years Ended Sept. 30, 1942-46

Grand Totals.....	32,305	34,600	35,284	34,595	38,703

Recidivism.—The percentage of repeaters, approximately one in every three convicted persons, has remained relatively the same during the past five years. In these statistics, a person is considered a second offender, or repeater, if he is convicted of two crimes or more, even though there may be only one court hearing. This tends to exaggerate the problem of recidivism, and it should be recognized that Table 7, giving the number of convictions, is affected by multiple convictions.

7.—First Offences, Second Offences, and Reiterated Offences of an Indictable Nature, Years Ended Sept. 30, 1942-46

Class of Offence	Numbers of Convictions					Percentages of First, Second, etc., Convictions to Totals

Acquittals in Relation to Convictions.—The ratio of acquittals to convictions for indictable offences for the period 1942-46 averaged 14.5 p.c. The percentages varied greatly as between the provinces in different years. In 1946, Ontario showed the highest percentage of acquittals with Quebec second and British Columbia third. Yukon and the Northwest Territories had the lowest percentage.

Sentences.—The proportions of the different types of sentences to the total number of convictions remained relatively the same over the five-year period 1942-46. The most noteworthy change was in death sentences given, which numbered 32 in 1946, the highest recorded for any one year since 1915 when there were 34. Life sentences, of which there were 8 in 1946, were higher than for any year since 1933 when there were 15.

Subsection 2.—Non-Indictable Offences

The following statistics relate to non-indictable offences of adults disposed of by Police Magistrates or other Justices of the Peace, under authority of the Summary Convictions Act. Such convictions showed an increase of 44.7 p.c. during 1946 as compared with 1945 and were 13.5 p.c. higher than for 1942, the previous peak year. Increases were general in all the provinces and in the Northwest Territories but there were fewer convictions in Yukon.

12.—Convictions of Adults for Non-Indictable Offences, by Provinces, Years Ended Sept. 30, 1937-46

NOTE.—Figures for 1900-12 are given at p. 1020 of the 1933 Year Book, for 1913-30 at p. 913 of the 1942 edition and for 1931-36 at p. 1113 of the 1946 edition.

Analyses of Convictions for Non-Indictable Offences.—In 1946, non-indictable crimes increased for all but four of the classes shown in Table 13. Vagrancy, traffic infractions, and offences against the liquor, prohibition and temperance Acts showed the highest percentage increases in 1946 over 1945, and 44 p.c. more convictions are evidence that many people still persist in owning a radio without a licence.

The crimes that diminished to some extent were frequenting bawdy houses which decreased 26.3 p.c. and offences against gambling Acts which were less than half the 1945 figure. Quebec showed a surprising drop of nearly two-thirds for gambling offences (13,968 in 1945 to 4,941 in 1946) and convictions in that Province were lower than for any year since 1930. That drop was responsible for the decrease in Canada as a whole and offset a rise in Ontario where offences against the gambling Acts almost doubled (728 in 1945 to 1,444 in 1946).

In connection with these ups and downs, it should be remembered that, while the Criminal Code undergoes little change over a period of time, the figures for summary convictions are greatly influenced by the customs of the people and show a tendency to fluctuate as municipal regulations are strictly enforced or allowed to lapse.

Convictions for Drunkenness.—The number of convictions for drunkenness increased by 37.1 p.c. in 1946 over 1945. Only Quebec showed a decrease, while Yukon remained the same. Of the other provinces, Prince Edward Island had the highest percentage increase, probably due to strict enforcement of the Province's prohibition law. The other provinces with an increase of over 50 p.c. were, in order, New Brunswick, Saskatchewan, Alberta, Nova Scotia and Ontario.

Offences Against the Liquor Acts.—Until the First World War, alcoholic liquors were generally sold under specified conditions by licensed hotels or licensed shops. Offences against the liquor Acts usually represented a breach of the conditions of sale. During that War prohibition was generally established but, in more recent years, the Provincial Governments have taken over the sale of liquor through commissions. Eight of the nine provinces now have such Liquor Commissions, Prince Edward Island being the only province in which prohibition prevails. In 1946, the number of convictions for offences against the liquor Acts reached the

highest figure on record, 33,362, an increase of 50 p.c. over 1945. All the provinces, except Quebec, contributed to this increase. Convictions in Prince Edward Island, British Columbia and the Northwest Territories more than doubled in numbers in one year while in New Brunswick, Saskatchewan and Alberta they increased by more than 50 p.c.

15.—Convictions for Offences Against the Liquor Acts, by Provinces, Years Ended Sept. 30, 1937-46

NOTE.—Figures for 1900-20 are given at p. 1022 of the 1933 Year Book, for 1921-30 at p. 915 of the 1942 edition and for 1931-36, at p. 1114 of the 1946 edition.

Breaches of Traffic Regulations.—At the beginning of the present century, when the motor-car was scarcely known and to-day's speeds even for freight movement were unheard of, convictions for breaches of traffic regulations numbered only 185 for all Canada. A strong influence in reducing convictions under breaches of traffic regulations in 1943, 1944 and 1945 was the removal, owing to wartime restrictions, of a large number of private and passenger vehicles from the highways. The lifting of these restrictions resulted in a record number of convictions in 1946. Such convictions accounted for 68.8 p.c. of those for all non-indictable offences in that year.

16.—Convictions for Breaches of Traffic Regulations, by Provinces, Years Ended Sept. 30, 1937-46

NOTE.—In 1938 and later years dangerous and reckless driving was classified as an indictable offence, as was leaving the scene of an accident from 1939 onwards. Figures for 1900-20 are given at p. 1023 of the 1933 Year Book, for 1921-30 at p. 915 of the 1942 edition and for 1931-36 at p. 1115 of the 1946 edition.

¹ Includes one in the Northwest Territories. No convictions were reported for the Northwest Territories for other years.

For the year 1946, Ontario, which had 43.8 p.c. of the registrations of motor-vehicles in Canada, had 59.8 p.c. of the total convictions; Quebec in the same year had 15.7 p.c. of the motor-vehicles and 27.3 p.c. of the convictions, and Manitoba 6.2 p.c. of the motor-vehicles and 5.8 p.c. of the convictions. In interpreting the figures in this way, however, it should be pointed out that traffic regulations are by no means uniform throughout Canada and no account is taken of the differences in the degrees of urbanization in the provinces. Thus, the above three provinces have large urban centres, while in provinces with lower degrees of urbanization such as the Maritimes, Saskatchewan and Alberta, convictions were low in proportion to the number of motor-vehicles registered.

Convictions of Females.—In 1946 all the provinces showed increases over the previous year in number of convictions of females for non-indictable offences except Nova Scotia and Quebec. Convictions of females in Ontario increased by 83.7 p.c. and in Prince Edward Island by 51.2 p.c. The increases in the other provinces were below 45 p.c.

Breaches of street-traffic regulations were the most numerous single offences by women, accounting for 18,017 in 1946 as against 9,001 in 1945. Drunkenness came next with 4,256, an increase of 805 over 1945. Convictions recorded as infractions of liquor Acts numbered 2,038 as against 1,829 in the previous year. Of a total of 33,805 convictions in 1946, no less than 1,021 were for the relatively minor offence of operating a radio receiving set without a licence.

PART II.—JUVENILE DELINQUENCY

Section 1.—Causes and Court Treatment of Juvenile Delinquency

Information on the causes and court treatment of juvenile delinquency is given at pp. 247-248 of the 1947 Year Book.

Section 2.—Juvenile Delinquency Statistics

Statistics published by the Dominion Bureau of Statistics deal primarily with delinquency cases disposed of by the courts and serve to further the program of the treatment of young offenders. The fact that juvenile court statistics furnish the most comprehensive figures collected on a Dominion-wide basis makes it important that the possibilities and limitations of these statistics be understood.

In the first place, it is impossible for any report to give a complete picture of juvenile delinquency, as many instances of minor offences are not detected, while others are settled by the police, social agencies, or school authorities without the necessity of apprehending the child. This is particularly true in rural districts where the courts are not readily accessible.

Secondly, the number of cases brought before the courts is influenced by such factors as the personnel and facilities of the court, and community interest in, and understanding of, the function of a juvenile court. Furthermore, it must be

remembered that as time goes on more courts are established and the added returns may exaggerate an apparent increase in delinquency or may under-estimate a decrease.

Thirdly, although the figures refer to offenders rather than offences, they do not represent the number of delinquent juveniles because some children may be brought to court more than once within a year, and in the tables of the report such children are recorded as separate individuals each time they appear on a new complaint.

Lastly, the number of delinquency cases reported by the courts is affected, to a considerable extent, by variations in the policies of the courts in the disposition of cases. Some courts handle certain cases unofficially, that is, in these cases legal papers are not prepared and the case is adjusted by the judge or other officer of the court without a formal court hearing. Although some of the courts report the cases as adjourned *sine die*, others consider the interview as an "occurrence", meaning that the case is not recorded as a charge.

Reports of juvenile offences were received in 1946 from 137 Judicial Districts. Yukon and the Northwest Territories were not included. Twenty Districts reported no offences, while one District failed to report. The reporting area for 1946, as for earlier years, is particularly representative of cities and towns, and includes 109 urban centres in Canada with populations of 4,000 or over.

Subsection 1.—Total Juvenile Offences

The terms 'indictable' and 'non-indictable' are applied only to offences of adults. Similar offences committed by juveniles are termed 'major' offences and 'minor' offences, respectively.

PERCENTAGES OF BOYS AND GIRLS BROUGHT BEFORE THE COURTS FOR ALL OFFENCES, 1937-46

Delinquents Brought Before the Courts.—The statistics for 1946 show that the decline in juvenile delinquency, first noted in 1943, is continuing. Children brought before Canadian courts during 1946 numbered 8,707 as compared with 9,756 in 1945, a decrease of 10·8 p.c. The number of young offenders charged with major offences decreased from 6,121 in the previous year to 5,409 in 1946, or 11·6 p.c. The number of juveniles charged with minor offences which were disposed of by the courts was 3,298 during 1946 as against 3,635 in the preceding year, a falling-off of 9·3 p.c.

Table 1 shows the number of cases brought before the courts, by provinces, from 1942 to 1946. In 1946 a decrease was apparent in each of the provinces, except New Brunswick and British Columbia, as compared with the previous year.

1.—Juvenile Offenders Brought Before the Courts, by Provinces, Years Ended Sept. 30, 1942-46

Totals.....	13,802	12,225	11,554	9,756	8,707	-10·8

The peak in delinquency among girls was reached in 1943, a year later than for boys, followed by a decline in numbers for both sexes. The ratio between boys and girls charged in court shows a gradual up-grading for the girls, though the actual number of girls appearing in court in 1946 was the lowest since 1939.

Trends in Juvenile Delinquency.—The first three years of the Second World War were marked by serious and rapid increases in juvenile delinquency. This was to some extent the outcome of the 'broken home' situation brought about by the enlistment of the male parent, the resultant removal of the father's restraining influence and the increase in the responsibilities placed upon the mother during his absence. The figures for 1942 reached an all-time high with 11,758 major and minor convictions. Since then there has been a gradual decline to 7,856 in 1946, but this figure is still higher than for any year during the period 1931 to 1939. Though the recent decline is hopeful, the picture is not quite so encouraging when all offenders up to the age of 18 years are taken into account. (See Table 8, p. 292.)

Many factors are contributing to the apparent decline in cases of delinquency. Communities are realizing that the solution to this problem is to be found in an extension of opportunities that will provide wholesome occupation for after-school hours, early detection and treatment of delinquents, better psychiatric service for schools and mental hygiene clinics, trained personnel for probation and juvenile court work, extension of parent counselling and parent education classes, and better housing. Family life has been strengthened by the return of fathers and older brothers from overseas service and the cessation of factory work for mothers. There is no longer the opportunity for highly paid employment which lured young people from school during the War. There is a more sympathetic interest in the activities of youth on the part of the police as is evident in the assignment of special constables to juvenile cases and the 'police and youth' program inaugurated by the Royal Canadian Mounted Police and adopted in many centres by municipal and provincial police. The payment of Family Allowances for children under 16 years of age and the continuance of a high rate of employment assisted materially in maintaining the downward trend.

In recent years changes have been made in provincial legislation for the better protection of youth. For example, in 1942 Alberta prohibited the employment of persons under 18 years of age in or about billiard rooms and bowling alleys. Although an amendment in March, 1945, permitted the employment of pin-boys under 18 while the War lasted, they had to have written consent from parents or guardians. In 1943 British Columbia passed the Curfew (Unorganized Territory) Act and Quebec the Compulsory School Attendance Act. In 1944 New Brunswick passed the Juvenile Court Act and Saskatchewan the Act to amend the Child Welfare Act whereby children who were wards came under the authority of the Department of Social Welfare rather than the Department of Labour and Public Welfare. In

Ontario an amendment to the Mothers' Allowances Act, 1946, makes provision for a child reaching 16 years of age during the school year to continue to receive an allowance until the conclusion of that school year unless he or she leaves school.

Subsection 2.—Major Offences

Table 4 shows the convictions of juveniles for major offences for the years 1937-46.

4.—Convictions of Juveniles for Major Offences, by Provinces, Years Ended Sept. 30, 1937-46

NOTE.—Figures for the years 1933-36 are given at p. 254 of the 1947 Year Book.

¹ Includes one conviction in the Northwest Territories.

In the ten-year period 1937-46, the number of convictions for major offences per 100,000 of the population went as high as 60 in the peak year of 1942. The number in 1946 was 40, the lowest figure recorded since juvenile delinquency statistics have been compiled separately from those of adult offenders.

Offences against property made up the bulk of major delinquencies (93.3 p.c.) and more than half of those were offences against property without violence (52.4 p.c.). This group includes all thefts without violence (49.7 p.c.). Offences against property with violence (burglary, breaking and entering) which were on the increase until 1944 followed the general downward trend in 1946. However, they still comprised a little more than one-quarter of the total convictions for major offences (27.3 p.c.).

Figures for offences against persons have not been more than 4.2 p.c. of the total number of convictions for major offences in the ten-year period under consideration and in 1946 were 3.5 p.c.

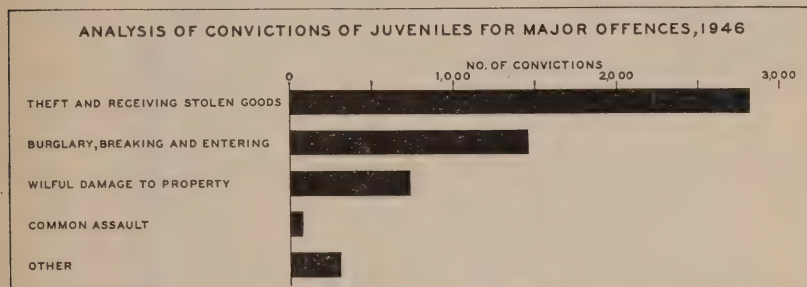

5.—Convictions of Juveniles for Major Offences, by Classes of Offence, Years Ended Sept. 30, 1937-46

Types of Major Offences Related to Age and Sex of Offenders.—The main reasons for reference to the court in boys' and girls' delinquency cases for major offences for the period 1942-46 are summarized in Table 6. The most frequent violations among the boys in 1946 were theft and receiving stolen goods (60·0 p.c.), burglary, breaking and entering (27·8 p.c.), being a form of misdemeanor offering more risk and excitement than any other, and malicious damage to property including arson (13·8 p.c.). The misdemeanors most prevalent among girls were theft and receiving stolen goods (52·7 p.c.) and offences against public morals (16·3 p.c.).

As children become older, the percentage of major offences tends to increase. In 1946 almost half the major offences were committed by boys and girls of 14 and 15 years of age. Only 6·8 p.c. of the convictions for such offences involved children under 10 years of age. The nine-year-old boys and 11- and 15-year-old girls were the only ages to show increases over the number of offences committed in 1945.

Education and Delinquency.—Assuming that six is the age of entering school, 63·2 p.c. of the juvenile delinquents in 1946 known to have attended elementary school were two years or more behind in school work. This retardation may have been due to other factors besides dullness, such as illness, change of residence, etc. Only 2 p.c. of the delinquents in elementary school were ahead of the normal rating and 9·7 p.c. were known to have attended high school.

Convictions of Juvenile and Young Adult Offenders.—While, officially, juveniles are persons under 16 years of age, in response to increased public interest in offences committed by young persons, the following table has been compiled, in which the convictions for indictable offences of persons aged 16 to under 21 have been added to the figures of juveniles found guilty of major offences. The rates per 100,000 population show the proportions of the offences committed by persons in three different age groups.

8.—Convictions of Juveniles for Major Offences and of Young Adults for Indictable Offences, Years Ended Sept. 30, 1942-46

NOTE.—Population figures used are official estimates.

Repeaters.—Experience, which dispels or increases resentment of authority, may be a factor in encouraging or deterring repeaters. Some of the responsibility for the attitude that is built up, be it good or bad, rests on the police, the probation officer, the staff of the detention home and the judge. The recollection of how he was picked up the first time, how he was handled while awaiting hearing, the opinion of those in whose care he is placed as to the possibility of his readjustment, all make an impression on a child.

Over the ten-year period, 1937-46, approximately one in every four children brought before the court failed to heed the first warning of the court and made at least a second appearance. The figures for major offences in 1946 show that in more than two-thirds of the cases (69.4 p.c.) the children were brought before the court for the first time, 16.1 p.c. were second offenders, 6.9 p.c. third, 3.1 p.c. fourth and 4.5 p.c. were dealt with by the courts five or more times. Previous court experience of boys and girls who were committed for major offences is shown in Table 9, covering the period 1937-46.

9.—First Offenders and Repeaters of Major Offences, 1937-46

1946.....	4,949	3,430	799	344	155	221	1,519	30.69

Disposition of Cases of Major Offenders.—The disposition of cases by the various courts depends on the practices within the courts and on the facilities for court supervision, for institutional care and for other services for children. Placing the child on probation of the court or his parents and suspended sentences accounted for more than half of the disposition of cases for major offences in 1946. The cases sent to training schools represented 14.5 p.c.

10.—Disposition of Delinquents Convicted of Major Offences, with Percentages of Total Major Offences, Years Ended Sept. 30, 1937-46

NOTE.—Figures for the years 1922-36 are given at pp. 259-260 of the 1947 Year Book.

Subsection 3.—Minor Offences

Convictions for minor offences, like those for major offences, have declined steadily since 1942, the decrease in 1946 from 1945 being 7.8 p.c. Table 11 gives a summary of convictions of juveniles for minor offences by types of offence for the years 1937-46.

11.—Convictions of Juveniles for Minor Offences, by Types of Offence, with Percentages of Total Minor Convictions, 1937-46

NOTE.—Figures for the years 1922-36 are given at p. 261 of the 1947 Year Book.

Disposition of Cases of Minor Offences.—The disposition of juveniles brought before the courts for minor offences is proportionately much the same as that for major offences. Over the ten-year period 1937-46, well over half the delinquents were reprimanded and allowed to go under supervision or have their sentences suspended. One in four made restitution for damages or paid a fine, and 13.6 p.c. were committed to training schools.

12.—Disposition of Delinquents Convicted of Minor Offences, with Percentages of Total Minor Offences, Years Ended Sept. 30, 1937-46

NOTE.—Figures for the years 1922-36 are given at p. 262 of the 1947 Year Book.

PART III.—POLICE FORCES IN CANADA*

The Police Forces operating in Canada are organized under three groups: (1) the Federal Force, which is the Royal Canadian Mounted Police and whose operations cover a very wide field in addition to purely police work; (2) the Provincial Police Forces—the Provinces of Ontario, Quebec and British Columbia have organized their own Provincial Forces, but the other provinces engage the services of the Royal Canadian Mounted Police to perform parallel functions within

* The material under this heading has been obtained through the courtesy of Commissioner S. T. Wood, C.M.G., of the Royal Canadian Mounted Police. Section 2, dealing with Provincial Police Forces, was submitted to Commissioner Wood by Geo. A. Shea, O.B.E., Secretary-Treasurer, Chief Constables' Association of Canada, who, in turn, received the basic data from the individual Provincial Police Commissioners.

their boundaries; (3) the Municipal Police—every city of reasonable size employs its own police organization which is paid for by the local taxpayers and which attends to purely police matters within the borders of the municipality concerned.

The organizations under these three headings are described in turn below.

Section 1.—The Royal Canadian Mounted Police

Name and Status.—The Royal Canadian Mounted Police is a Civil Force maintained by the Dominion Government. It was organized in 1873 as the North West Mounted Police, whose duties were confined to what was then known as the Northwest Territories. By 1904, the work of the Force received signal recognition when the prefix "Royal" was bestowed upon it by King Edward VII. In 1905, when Alberta and Saskatchewan were constituted Provinces, an arrangement was made whereby the Force continued to discharge its duties as formerly, each Province making a contribution towards defraying the cost. This was continued until 1917.

In 1918, the Royal North West Mounted Police was assigned the duty of enforcing Dominion legislation for the whole of Canada west of Port Arthur and Fort William. Soon after the end of the First World War, an extension of governmental activities made it obvious that the enforcement of Dominion statutes throughout Canada must be the responsibility of a Dominion Force and, therefore, the jurisdiction of the Royal North West Mounted Police was extended to the whole of Canada early in 1920. In that year, the name of the Force was changed to the Royal Canadian Mounted Police and the former Dominion Police with Headquarters at Ottawa, whose duties were largely connected with guarding public buildings in that city and the Canadian Government dockyards at Halifax, N.S., and Esquimalt, B.C., were absorbed by the Royal Canadian Mounted Police.

Control and Organization.—The Force is controlled and administered by a Minister of the Crown (at present the Minister of Justice) and, as stated above, may be employed anywhere in Canada. Its officers are commissioned by the Crown and for many years have been selected from serving non-commissioned officers.

The Force is divided into 14 Divisions of varying strength, including the Marine Section, distributed over the entire country. The term of engagement for recruits is five years, and the minimum age for a third-class constable is 21 years. Recruits are trained at Regina, Sask., and Rockcliffe, Ont. Police Colleges are also maintained at these centres, where courses of training and instruction are given to keep the Force abreast of the latest developments in criminology.

From a total of 300 in 1873, the Force grew to over 4,700 by 1944 and in 1948 had a strength of approximately 3,200. Its means of transport consists of 192 horses, 754 motor-vehicles, 6 aeroplanes and 264 sleigh dogs; 17 trained police dogs are maintained for tracking. Its Marine Section at present consists of 219 officers and men and 19 vessels of various sizes. The R.C.M. Police Aviation Section has a personnel of 17.

In 1937 a Reserve was established which in 1948 numbered over 324: units are located principally at such large centres as Montreal, Toronto, Winnipeg, Edmonton, Calgary and Halifax, where men can be congregated easily, and where instruction can be given in the evenings.

Duties.—The Royal Canadian Mounted Police has the responsibility for enforcing Dominion laws throughout Canada and is specially empowered to deal with infractions against smuggling by sea, land and air. It also enforces the provisions of the Excise Act, and is responsible for the suppression of traffic in narcotic drugs. In all, the Force has responsibility in almost 50 Dominion Acts including the Indian Act. It also assists many departments of the Dominion Government in administrative duties and is responsible for the protection of Government buildings and property and some of the more important dockyards. It is the sole police force operating in the Northwest Territories and Yukon. Furthermore, it undertakes secret and security services for the Dominion Government. In addition to its Dominion duties, the Force has agreements with the Provinces of Alberta, Saskatchewan, Manitoba, New Brunswick, Nova Scotia and Prince Edward Island, whereby the services of the Royal Canadian Mounted Police can be secured to enforce provincial laws and the Criminal Code in rural districts upon payment for such services. These agreements have been in force for more than 15 years.

During recent years, the Force has also entered into agreements for the policing of more than 70 cities, towns and municipalities within the six provinces mentioned above.

Services to Other Police Forces.—The Royal Canadian Mounted Police maintains two scientific laboratories for the examination of exhibits of all kinds, and these services, as well as its central fingerprint, modus operandi, and firearms bureaus, anti-counterfeiting and other facilities are available to all police forces. It also maintains two Police Colleges which selected personnel from other police forces may attend.

Youth and the Police.—Since the autumn of 1945, members of the Royal Canadian Mounted Police have made a concerted effort to assist the youth of Canada in developing a healthful outlook towards the police, law, order and responsible citizenship. This is being done in many ways. Volunteer speakers, who are qualified for the work, go before youth groups of all kinds and speak on such subjects as Discipline in Everyday Life, History of the Royal Canadian Mounted Police, Courtesy and Kindness, and Functions of the Police in Society; considerable use is made of films. With the permission of the Departments of Education and local school boards, all the schools in each province are being covered as well as youth groups supervised by service clubs and churches. Interest is also being taken by members of the Force in various training schools set up to handle delinquents.

An effort is made to show the policeman as a public servant, essential to the well-being of the country, a referee in a game the rules of which have been made by members of the community for the greater comfort and security of all. The program does not compete with that of other organizations engaged in youth work; rather, it seeks to co-operate with these organizations. Indeed the work with youth has created a demand from adult groups interested in youth guidance for speakers to tell how the program functions.

The Force is also doing invaluable voluntary work in supervising recreational facilities, teaching first aid, coaching hockey and baseball teams and promoting many other recreational activities. This phase of youth work is in keeping with the thought that the excess energy of youth should be directed into healthful and

creative channels. The key-note of the program is co-operation between the Royal Canadian Mounted Police, other police forces and all agencies interested in the future of the youth of Canada.

Section 2.—Provincial Police Forces

Quebec Provincial Police Force.—The Quebec Provincial Police Force is responsible for upholding law and order over the whole territory of the Province, from the provincial boundary between Ontario and Quebec to the Magdalen Islands in the Gulf of St. Lawrence.

This Force, composed of about 600 men, is in charge of a Director who acts under direct orders from and is responsible to the Attorney-General of the Province.

To facilitate operations, the territory is divided into two almost equal parts designated as the District of Montreal and the District of Quebec. The Director has his office at Montreal and an Assistant Director at Quebec city. Working under these Directors are two deputies.

The Police Force is itself divided into three sections: the detective corps, the constabulary and the traffic officers, each of which, in the two Districts, is in charge of a captain supported by a number of lieutenants and sergeants. This Police Force, which has for years enjoyed an enviable reputation for the successful policing of Quebec's highways and for its great efficiency in solving crimes, has been in course of reorganization for the past three years. During this time, the highway motorcycle patrol has been gradually replaced by a fleet of automobiles which have proved much more efficient, especially during the winter months.

The first installation of a province-wide frequency modulation radio-communication system has been established in the District of Montreal. A main station, using the 35.22 band and operating on the top of Mount Royal, directs radio-equipped cars within a radius of between 60 and 80 miles around Montreal. Statistics are not available at the present time, but an idea of the amount of work done is easily conceived from the fact that over 20,000 calls were sent out over the antenna of the main radio station during 1946. Sub-stations operate at each of the eight bridges giving access to or exit from the city of Montreal itself and a number of cars, all equipped with frequency modulation three-way radio units, patrol the surrounding country day and night.

The Quebec Provincial Police Force, well-trained and alert, is in a position to provide the citizens of the Province with the protection they have a right to expect from it.

Ontario Provincial Police.—The Ontario Provincial Police is maintained by the Government of the Province of Ontario under the Attorney-General's Department. The Force is responsible for law enforcement in the rural and unorganized parts of the Province, and in certain municipalities by contract.

History relates that in July, 1875, John Wilson Murray was appointed to act as "Detective for the Provincial Government of Ontario" to pursue criminals and "run them down" in their havens of refuge. Murray performed his varied duties under the direction of Sir Oliver Mowat, the Attorney-General of the Province. At the time of Confederation and the first session of the first Parliament of Ontario in December, 1867, there were a number of rural or Provincial Police. These officers were unpaid and if any remuneration was received for their services it was derived through the fee system.

In 1877 a major reform occurred when under the Constables Act (R.S.O. 1877, c. 72) the necessity for giving certain constables jurisdiction throughout the Province was recognized. County judges were authorized to allocate Provincial Constables to every county and district in Ontario.

Later, the opening up of the mining areas in the north of the Province and the accompanying lawlessness brought to the fore the realization that more adequate law-enforcement measures were a necessity. Consequently, an Order in Council dated Oct. 13, 1909 (confirmed by 10 Edw. VII, c. 39, 1910) was passed providing for the establishment of the "Ontario Provincial Police Force", to be composed of a Superintendent and such inspectors and constables as were deemed necessary. The officers were stationed throughout the northern portion of the Province and at all border points in southern Ontario. The Force was completely reorganized; in 1921, under the authority of the Ontario Provincial Police Act, the appointment of a Commissioner of Police for Ontario was made and the strength of the Force considerably increased.

The Constables Act was amended in 1929 with a view to establishing closer relationship and co-operation between the Provincial Police Force and County Constabularies. Twenty-eight counties took advantage of this legislation and a member of the Ontario Provincial Police was appointed as Acting High Constable in each of these counties. In 1929 also, an Ontario Provincial Police Training School was established at General Headquarters for the tuition and guidance of recruits.

In March, 1930, the control and administration of the officers who had been enforcing the Highway Traffic Act under the supervision of the Department of Public Highways was transferred to the Department of the Attorney-General under the Commissioner of the Ontario Provincial Police. A combined Provincial and Municipal Police Training School was inaugurated at Toronto in March, 1935. This school provides advanced training in medical, legal, scientific and technical activities for provincial and municipal police officers.

By the Police Act, 1946, proclaimed Feb. 1, 1947, all former legislation and amendments dealing with constables were repealed. Under this Act, the duties and responsibilities of police forces are, for the first time in the history of the Province, clearly defined. Up to Mar. 31, 1948, 52 municipalities have availed themselves of the provisions of the Police Act, for the policing of their municipalities by the Ontario Provincial Police.

At present the Force, with a strength of approximately 811, consists of a General Headquarters at Toronto and 16 Districts with headquarters at: Chatham, London, Dundas, Niagara Falls, Aurora, Mount Forest, Barrie, Peterborough, Belleville, Perth, Cornwall, Haileybury, Sudbury, Cochrane, Port Arthur, and Kenora. Each district has detachments adequate to meet law-enforcement requirements. A Criminal Investigation Branch of the Force, under the command of a Chief Inspector, is maintained at Toronto. This Branch investigates crimes of a major nature. A frequency modulation radio-communication system is being installed to assist the Force in coping with the ever-increasing demands of law enforcement.

British Columbia Provincial Police.—The organization of a permanent police force in British Columbia followed the influx of gold seekers on the Fraser River in 1858. Prior to that time police protection on Vancouver Island had been of a volunteer nature, the settlers themselves forming posses to apprehend flagrant law breakers.

On July 7, 1858, a Commissioner of Police was appointed together with a chief constable, a sergeant and four or five constables and a staff to maintain a gaol for Vancouver Island. The Governor was alive to the necessity of a police force for the gold-field area of British Columbia and Gold Commissioners were appointed under the Goldfields Act to each of whom were assigned six police officers. Instructions, however, came from the Governor.

The Commissioner continued the supervision of the police on Vancouver Island, acting at the same time as Magistrate for the community at Victoria.

It will be seen from these regulations that control of the police was somewhat divided but in 1866 the Crown colonies of Vancouver Island and British Columbia were united and the police came under one head at Victoria. New territory was opened up and local justices of the peace were empowered to swear in special constables in cases of necessity.

In these early days the duties of a constable were interwoven with the tasks of other Government branches such as the collection of revenue and other offices unrelated to law enforcement. As time went on, however, the duties gravitated to full-time police service and police districts were established under the control of a Chief Constable who, in turn, was responsible to the Chief Inspector (later the Superintendent). With minor changes, this system continued until 1923 when, by the Police and Prisons Regulations Act 1923, semi-military ranks were adopted and the Province was divided into Divisions, Districts and Detachments for administration purposes. There are now 5 Divisions, 2 Subdivisions, 27 Districts and 114 Detachments, with a total strength of 431 all ranks.

A Criminal Investigation Branch is operative at Headquarters together with a training school. Shortwave radio is used extensively connecting 23 key stations throughout the Province and eight police boats patrolling the coast are also equipped with shortwave and voice transmission.

Provincial Police also assist Dominion as well as Provincial Departments seeking their aid and municipalities in 1925 were afforded the opportunity to contract Provincial Police Protection; 44 cities have signed these contracts since the amendment.

The Provincial Police has contributed invaluable help to youth activities. Talks are given on such subjects as behaviour, good citizenship, traffic safety, firearms and explosives, camping and camp precautions, first aid, etc. Voluntary assistance is also rendered to promote sports and games, and youth organizations call upon individual members of the Provincial Police for instruction.

Section 3.—Municipal Police Statistics

In 1946 police statistics were collected from 189 urban centres with 4,000 or over population. The aggregate population of these centres was 5,103,849 (1941) and the total number of policemen was 6,954 or one for every 734 of the population.

A total of 508,646 offences were reported to the police, arrests numbered 158,291 and 322,715 summonses were issued. Of the 10,013 automobiles reported stolen, 9,958 were recovered, and 16,616 of the 18,959 bicycles reported stolen were recovered. The value of other goods reported stolen was \$4,634,287 and the value of stolen goods recovered \$2,092,218.

There were 60,801 automobile accidents reported, as a result of which 541 persons were killed and 16,098 injured; in other accidents reported, 747 persons were killed and 7,821 injured. Persons given shelter in police stations numbered 49,526 and 11,056 stray children were returned to their homes.

PART IV.—PENITENTIARY AND REFORMATORY INSTITUTIONS

Section 1.—Penitentiary Statistics*

The Penitentiaries Branch of the Department of Justice is charged with the administration of the various penitentiaries of Canada. Seven institutions are included in the system, the two largest of which are at Portsmouth, Ont., and St. Vincent de Paul, Que., while the other five are at Dorchester, N.B.; Prince

* Revised in co-operation with the Superintendent of Penitentiaries, Department of Justice, Ottawa.

Albert, Sask.; Stony Mountain, Man.; New Westminster, B.C.; and Collins Bay, Ont. During the fiscal year ended Mar. 31, 1947, the average daily population of these institutions was 3,541 and the total net cash outlay for the year was \$3,654,072 or \$2.83 per convict per diem, compared with 3,028 average daily population and \$2,689,059 total net cash outlay or \$2.43 per convict per diem for the year 1941.

Female convicts given penitentiary sentences in the different provinces are sent to the penitentiary at Kingston, Ont., where special quarters and staff are maintained for their detention and supervision. Female convicts in custody on Mar. 31, 1947, numbered 56 compared with 43 in 1944 and 46 in 1941.

Movement of Population of Penal Institutions.—Penal institutions may be classified under three headings: (1) penitentiaries, with slow turnover, since prisoners have long sentences; (2) reformatories and training schools, also with rather slow turnover; and (3) common gaols, where the turnover is extremely rapid. If the average population for the year be taken as the average of the figures for inmates at the beginning and at the end of the year, and the number discharged be the turnover, the percentage turnover in fiscal year 1946-47 was: in penitentiaries, 48.1 p.c.; in reformatories and training schools, 164 p.c.; in gaols, no less than 1,728 p.c. In dealing with these figures it must be borne in mind that the common gaol population changes from day to day, and is partly made up of accused persons awaiting trial who may be either liberated or sent to a penitentiary or reformatory.

1.—Population of Penal Institutions, for Twelve-Month Periods (Circa) 1945 and 1946

Year and Type of Institution	In Custody Beginning of Year	Admitted During Year	Dis- charged During Year	In Custody End of Year
1945				
Penitentiaries.....	3,078	1,472	1,421	3,129
Reformatories and training schools ¹	4,409	7,647	7,818	4,224
Gaols ²	3,206	53,801	53,026	3,981
Totals, 1945.....	10,693	62,920	62,265	11,334
1946				
Penitentiaries.....	3,129	1,794	1,561	3,362
Reformatories and training schools.....	4,224	8,063	8,183	4,104
Gaols.....	3,958	65,768	65,545	4,181
Totals, 1946.....	11,311	75,625	75,289	11,647

¹ Revised since the publication of the 1947 Year Book. The list of training schools was changed to include new institutions and delete those not caring for delinquent children committed through the courts.

² Revised due to a change in the Quebec reporting year from a fiscal to the calendar year.

Tables 2 to 4 give the more important penitentiary statistics as reported to the Bureau of Statistics.

Section 2.—The Ticket-of-Leave System*

The Ticket-of-Leave or Parole System rests on the power of the court to suspend, conditionally, the imposition or the execution of a sentence.

Its aim is to achieve, through the substitution of a form of control or treatment, the reformation or civil rehabilitation of a prisoner outside of close imprisonment. The British ticket-of-leave system began in 1660 when statutory power was given judges to transport prisoners to the colonies, where, after a penal settlement period was fulfilled, they were allowed for the remainder of their sentence the freedom of the colony, under certain restrictions. All such prisoners were prohibited from carrying firearms and had to report monthly, quarterly or yearly for inspection to the authorities. By 1840, transportation of prisoners was disallowed but a new policy of imprisonment was inaugurated under which all long-term convicts must pass through the prisons for a period before conditional release on Ticket-of-Leave could be granted. When released, the convict is kept under the surveillance of the police and reports at stated periods. He is returned to prison for any infraction of this Ticket-of-Leave licence. The British system is altogether automatic in operation.

Other countries have also adopted the parole system. It was accepted in Germany in 1871, the Netherlands in 1881, Japan in 1882, the French Republic in 1885 and has since been used by Austria, Italy and Portugal. A number of the States in the United States have now a system of parole or conditional liberation in force for prisoners.

* Prepared under the direction of Commissioner S. T. Wood, C.M.G., of the Royal Canadian Mounted Police.

In Canada the parole system was first adopted for penitentiaries in 1899 and was later extended to include gaols and reformatories. In this the Canadian system differs from every other parole system in the world. The parole system was legalized under the Ticket-of-Leave Act (R.S.C. 1927, c. 107).

It is the duty of the Minister of Justice to advise the Governor General on all matters connected with or affecting the administration of the Ticket-of-Leave Act. By an order in writing, under the hand and seal of the Secretary of State, the Governor General may grant to any prisoner under sentence of imprisonment in a penitentiary, gaol or other public prison or reformatory Ticket-of-Leave to be at large in Canada or any specified part thereof during such portion of his or her term of imprisonment and upon such conditions in all respects as the Governor General may see fit.

The working of the Ticket-of-Leave Act in Canada is in the following manner. Any convict serving a prison term, or any person on behalf of a prisoner, may make application through the Minister of Justice for a Ticket-of-Leave. Each application, whether received from the most humble petitioner or from a person of high standing in the State or the community, receives the same very careful attention. Reports and opinions are requested from the trial¹ Judge, the police who handled the case and the warden of the prison where the prisoner is incarcerated. The past environment and the previous criminal record, if any, of the prisoner are studied. All the circumstances in each case are carefully considered by well qualified investigators in the Remission Service Branch of the Department of Justice. If the consensus of opinion is that the prisoner has profited by the time spent in prison and it is felt that an exercise of clemency will result in the prisoner becoming rehabilitated and again a useful member of society, and if honest, gainful employment and proper supervision are assured, then the Solicitor General recommends to His Excellency the Governor General that the subject be released to serve the remainder of his sentence under the restraint of a Ticket-of-Leave. The Governor General approves by placing his official signature thereon. The offender is then issued with a Ticket-of-Leave licence under the hand and seal of the Secretary of State and is released from prison to serve the remaining portion of his sentence at large, subject to the conditions and provisos laid down in his licence.

The Commissioner of the Royal Canadian Mounted Police has been designated by the Ticket-of-Leave Act to enforce the conditions under which each Ticket-of-Leave subject is liberated. This he does through the Ticket-of-Leave Section, Identification Branch, located at Ottawa.

Every holder of a Ticket-of-Leave licence, upon release, is required to notify the place of his residence to the Chief Officer of Police or Sheriff of the city, town or district in which he resides and, whenever he is about to leave a city, town, county or district he is obliged to notify such intention to the said Police Officer or Sheriff of that place stating the place to which he is going and, if possible, his intended address. Upon arrival at his new destination he is required to notify the local Police Officer or Sheriff. Further, each male Ticket-of-Leave subject

is required to report once each month, so long as his Ticket-of-Leave period is in force, to the Chief Police Officer or Sheriff of the place in which he resides, unless this condition has been remitted by the Order of the Governor General.

A Ticket-of-Leave subject must produce his licence if called upon to do so by a magistrate or police officer; he is required to abstain from any violation of the law; shall not habitually associate with notoriously bad characters such as reputed thieves and prostitutes; he shall not lead an idle and dissolute life without visible means of obtaining an honest livelihood and is required to carry out any additional condition that has for reason been attached to his licence.

The Ticket-of-Leave Branch receives very efficient co-operation from the police forces throughout the country. Through their help, record is kept of each Ticket-of-Leave subject at large in Canada and monthly reports are forwarded to Headquarters. Most police forces treat Ticket-of-Leave information as strictly confidential; exercise care in protecting those concerned from embarrassment; give sympathetic consideration to the problems of these unfortunates and are ever ready to give assistance and helpful advice to anyone who is honestly endeavouring to rehabilitate himself.

He who fails to carry out the minor provisions of his release is at first admonished and given another chance. If, however, no heed is taken of rebuke, the Governor General may order the licence of the subject so transgressing to be revoked. In this case the culprit will be, by warrant, recommitted to prison to serve the portion of his sentence that was unsatisfied at the time he was granted Ticket-of-Leave.

If any holder of a licence under the Ticket-of-Leave Act is convicted of an indictable offence, his licence is forfeited. This is the only automatic feature of the Canadian Ticket-of-Leave system. In the case of forfeiture, the subject must first complete the sentence given on account of the indictable offence; he is then recommitted by warrant to prison to serve the portion of the former sentence that remained unsatisfied when he was granted Ticket-of-Leave.

The Ticket-of-Leave subject is not pampered. He is made to realize that he has been justly punished by imprisonment for offence committed and that judgment has been tempered with mercy by permitting him to serve part of his just sentence at large under the mild restraint of a Ticket-of-Leave licence. On the other hand, no unjust advantage may be taken of him. He has all the rights and liberties of any free Canadian citizen to engage in any honest enterprise or occupation and is fully protected by law from any impositions whatever.

The number of convicts released on Ticket-of-Leave each year from penitentiaries, gaols and reformatories varies between 700 and 1,000 persons. From the time the system was inaugurated in the year 1899 to the fiscal year ended Mar. 31, 1947, 35,043 offenders have been so released. During the 48 years Ticket-of-Leave has been in operation in Canada only 5.4 p.c. of the total number released have lapsed into crime that has necessitated return to prison.

Criticism is occasionally heard when publicity is given to some case of a Ticket-of-Leave subject who is again convicted of crime. Because of the strictly confidential nature of this work, nothing is ever heard of the more than 90 p.c.

of subjects who become useful and respected citizens. The Canadian Ticket-of-Leave system has indeed proven well worth while from a humanitarian as well as from an economical standpoint. The following statement gives a report of the Ticket-of-Leave Section from its inauguration to Mar. 31, 1947.

	No.
Released on Ticket-of-Leave from penitentiaries.....	15,755
Released on Ticket-of-Leave from gaols and reformatories of all classes.....	19,288
Total Releases.....	35,043
Revocations and cancellations of licences for failure to comply with conditions....	944
Forfeitures of licences on account of convictions for indictable offences.....	958
Sentences completed on Ticket-of-Leave in good standing.....	32,633
Sentences not yet completed.....	508
Delinquent percentage.....	5.4

Section 3.—Statistics of Corrective and Reformative Institutions

A census of corrective and reformative institutions is taken at five-year intervals, the latest being for June 1, 1946. At that date there were 28 such institutions in Canada, 25 of which reported: one institution in Quebec, one in Ontario and one in Manitoba failed to report. The reporting institutions had a total inmate population of 3,662, of whom 2,930 were males and 732 females. The males were confined in 13 institutions and the females in 12.

According to the British North America Act, education is a function of the Provincial Governments and, therefore, the schools and universities, teacher training and other matters involved in the formal educational field are planned, financed and controlled by the provinces.

However, in a broad sense, education cannot be limited to merely what is taught in schools and colleges. It is as broad as life and experience itself and, for that reason, this Chapter of the Year Book deals also with such subjects as libraries, art and scientific research. Certain agencies of the Federal Government, while not in any sense in conflict with the formal field of education ascribed by the Constitution to the provinces, have functions that concern education. Among these agencies are the National Film Board and the Canadian Broadcasting Corporation. Thus, while the Canadian Broadcasting Corporation is engaged more in the field of entertainment and recreation than in that of education, there are aspects of its work that are properly included in the broader field. These are dealt with in Section 3 of Part II of this Chapter and cross references are given to the non-educational features of these agencies that are dealt with elsewhere in the Year Book.

PART I.—THE FORMAL EDUCATIONAL FIELD IN CANADA

Section 1.—Current Trends in Canadian Schools*

In a period of freer money and rising costs, education in Canada finds itself with more money to spend but with greater expenses to meet. While increased revenue is available for construction of buildings, improvements and salaries, building costs have mounted tremendously, many materials are still scarce, and salary increases to administrators and teachers have hardly kept pace with the cost of living. Nevertheless, the interchange of ideas and population during the War, the recognition that immense sums of money could be found for waging war, and a realization of the importance of an educated and trained population in time of emergency, have led provincial and many municipal authorities to regard education as of special significance in modern society, and accordingly to give it greater financial support.

* Prepared by the Canadian Education Association, Toronto.

Larger Units in School Administration.—A notable trend in Canadian education has been toward the larger school unit. This permits a greater equalization of educational costs and a greater degree of equality of educational opportunity for the pupils. In most provinces progress has been made in this regard, particularly in the past two or three years. Since 1946 the larger unit has been in operation in all Nova Scotia's 24 municipalities. In New Brunswick the County Schools Finance Act was passed in 1943 and by January, 1948, all counties had agreed to adopt this method of school administration. In consequence 1,350 administrative school units have been reduced to 37, embracing 15 counties and 22 urban centres. In Ontario the larger unit is known as a Township School Area. The formation of the 484 Township School Areas now in existence has involved the dissolution of 3,070, or approximately 53 p.c., of the former rural school areas of the Province. Rural schools in Saskatchewan have been set off into 60 proposed units, 45 of which, embracing 3,794 former units, have been established. In both Alberta and British Columbia the larger unit is an accomplished fact; indeed in the former Province it has been established for 10 or 15 years. In Alberta, where there are 57 School Divisions, on the average a School Division has an area of 2,000 square miles, employs 70 teachers, and instructs 1,500 pupils. British Columbia is divided into 74 large administrative areas, and 15 small rural unattached School Districts. In Manitoba an experimental larger school unit has been established, with consideration being given to an additional one; prior to 1920, however, this Province had moved towards the consolidation of School Districts, though not necessarily to the more modern School Area built around a logical community centre. In Quebec (Protestant) ten (or over one-half the total desired) Central School Boards have been established. The Catholic School Commissions in Quebec are not larger units, properly speaking; the basic unit there is generally the Parish. It should be recognized that the consolidation described above may have varying effects, dependent upon the province. In some cases it may involve only elementary rural schools, in others regional high schools, and in others a combination of both. In each instance better educational opportunities for children in rural areas are provided.

The establishment of the larger administrative unit, while resulting in an over-all economy, has increased the problem of the transportation of school children. In a number of cases conveyance is obtained by the hiring, on a contract basis, of buses owned by individuals or by transportation companies, though there is a marked trend towards purchasing rather than hiring buses for purposes of school transportation. In Quebec the first 'snowmobile' was purchased in 1943 and the Protestant Department operates 49 of these machines which transport more than 1,500 pupils. In Ontario, Public or Separate School Boards have authority to transport pupils to their own or secondary schools, and in June, 1947, 350 vehicles transported 8,400 children to 160 secondary schools. Their average trip required 65 minutes and the cost for such transportation was about one cent per pupil per mile. In Alberta in 1947-48 there were 713 school conveyances transporting a daily total of 14,753 pupils. Various safety standards are maintained in all provinces where pupils are conveyed by departmental arrangements.

Modern Types of School Facilities.—Both New Brunswick and Nova Scotia have extensive plans for new regional Composite High Schools. In New Brunswick 25 have been approved and are under construction; nine are now in operation. The rural high school in Nova Scotia, where enrolment in a con-

solidated area makes its establishment desirable, will provide services and facilities for Grades VII to XII. Plans include a minimum of four academic classrooms, mechanic and domestic-science facilities, school garden and demonstration plot, adequate playground space and, where necessary, hostels for boarding of pupils. Tenders for two such schools have been called for, and five or six additional ones were projected during 1948.

A Committee on Planning, Construction, and Equipment of Schools in Ontario presented an Interim Report in 1945. In 1947 a demonstration school, the V. K. Greer Memorial School, was completed at a cost of \$78,000, to exemplify the findings of this Committee. Details of its construction are suggestive, since it illustrates a rural central school adapted to more efficient teaching and greater flexibility of classroom procedure. Economical in design, the four-classroom, one-storey building is constructed without a basement. Pastel shades are used on walls and ceilings which are of acoustical material to reduce the carrying of noise. Floors are of asphalt tile laid in mastic on a concrete slab. Woodwork has been given two coats of white shellac and two coats of wax to prevent dirt from adhering. Blackboards are of green glass composition, on which contrasting chalk is used. There are special lights over the blackboard as well as indirect lighting. Drapes have replaced window shades. The rooms are equipped with form-fitting, adjustable desks or individual study desks and chairs of correct sizes. There are well-equipped rooms for home economics and industrial arts and crafts, and a large playroom-auditorium. The construction of this model school has influenced considerably plans for other schools now built, or in the process of building. The total cost of elementary schools completed in 1947 in Ontario was about \$10,500,000.

A modern Composite High School is being erected at Ottawa at a cost of \$1,650,000 with projected accommodation for 950 pupils. In Winnipeg, Man., a by-law was endorsed by the electors in October, 1947, to build a Technical-Vocational High School at a cost of \$1,500,000. The school will be organized to cover certain "families of occupations" such as electrical crafts, metal crafts, household and personal service occupations, etc. In Saskatchewan there is a greater emphasis upon vocational education, use of the library, adult education, and the use of the school as a community centre. Fourteen centres in the Province have converted their present high schools into Composite Schools which include the above features. In Alberta the Red Deer Composite High School was established in 1947-48. This has an enrolment of 473 pupils, a staff of 23 teachers, operates dormitories for boys and girls accommodating 270 students, and offers both academic and vocational subjects. The trend in British Columbia is toward Composite High Schools with special technical and commercial departments, rather than toward separate specialized institutions. However, a Vocational School is now being built at Vancouver at an estimated cost of \$1,800,000.

Teacher Supply.—In spite of a general increase in salaries the shortage of fully qualified teachers has grown more acute. The most serious problem is in one-room rural schools where there was, in 1947-48, a total shortage of 6,575 fully qualified teachers. Of these schools 318 were closed because no teachers at all could be secured, and 6,257 were in the hands of teachers who were not fully qualified. On the other hand there was an increase in enrolment in teacher-training institutions across Canada from 6,866 in 1946-47 to 7,833.

The improved relationship of salaries to the teacher supply situation is most marked in the Maritime Provinces. Taken as a unit, they show not only the greatest relative improvement in statutory minimum salaries, but in teacher supply and in

enrolment in teacher-training institutions. While the other provinces do not show any improvement in the past year in statutory minimum salaries, they do indicate a general increase in their estimates of median salaries in rural schools.

Many School Boards in Canada have revised their salary scales during the past year, paying increased salaries or cost-of-living bonuses. Outside of the Maritime Provinces, whose schools are largely rural, this is not reflected as yet in any change in statutory minimum salaries authorized by the provinces. As a result, the teacher who begins his professional career in the rural school or, as is often the case, continues to teach in such a community, is generally unaffected by improvement in conditions of urban teachers. For example, the secondary teacher supply situation, which is largely urban, showed a marked improvement in 1947. The shortage of secondary teachers was 198 as compared with 400 in 1946. There were 2,319 secondary trainees enrolled in teacher-training institutions in 1947 against an annual enrolment required of 1,515.

In 1947 both Nova Scotia and Saskatchewan adopted salary scales which showed substantial increases and were related to the experience and the class of certificate of the teacher.

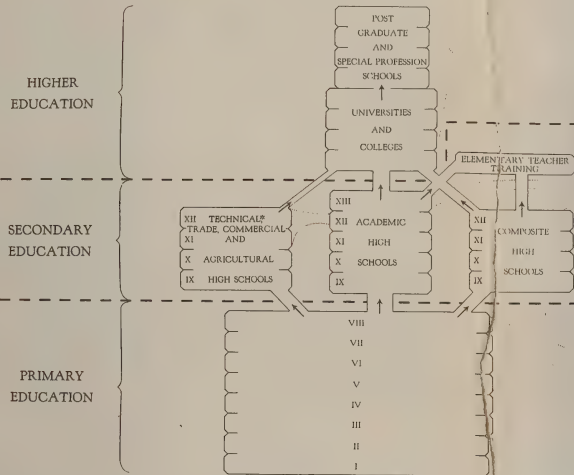

Among the steps taken by various Provincial Departments of Education to meet the present teacher shortage, in addition to encouraging increased salaries, have been loans without interest to Normal School students, provision of scholarships, the issuing of permissive or provisional licences, accelerated teacher-training courses or special emergency training classes, the closing of some schools and the transportation of the pupils to schools in an adjacent area, and some increase in the use of correspondence courses. Arrangements have been made for giving greater supervision and teaching assistance to teachers who temporarily lack full qualifications.

Employment of Teachers—

In September, 1947, the Canadian Education Association appointed a Committee to study and report on the status of the teaching profession. The report was presented at the Winnipeg meeting of the Association in September, 1948. The Committee, using the questionnaire method with sample groups in each province, obtained from a cross-section of those in education and industry views regarding teachers and the teaching profession. Of the 4,920 questionnaires distributed, 60 p.c. were returned, with general agreement that: (1) salaries and pensions for teachers must be increased substantially; (2) living and working conditions as they affect housing, school plant, school equipment, class load and other factors must be improved; (3) those accepted as candidates for the teaching profession must have a higher standard of general education, acceptable character and personality traits and above-average intelligence; (4) assistance should be given selected trainees by means of scholarships and other financial aid. A Committee was appointed to initiate a program of action designed to carry out the recommendations of the report.

Other Trends.—Increased emphasis is being laid throughout Canada on Audio-Visual Aids in education. This is shown by the purchase of projectors, films and radio receiving sets by school units, and central provincial libraries. Audio-visual aids courses were held in both Toronto and Victoria in the summer of 1947 with special attention being given to selection, evaluation and utilization techniques. The Canadian Broadcasting Corporation, as well as a number of

EDUCATIONAL LADDER FOR PUBLICLY CONTROLLED ENGLISH LANGUAGE PROVINCES

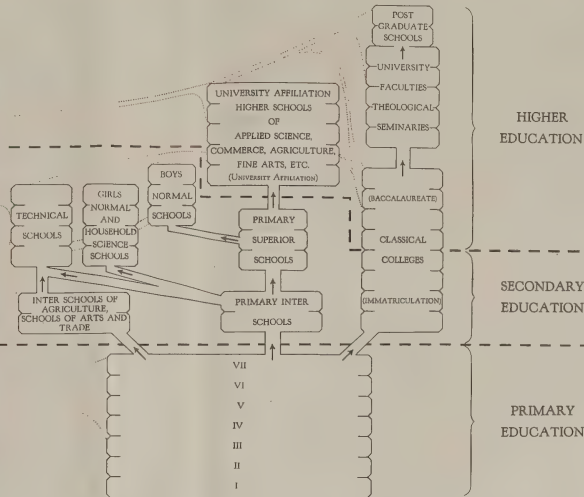

*Ontario has specially organized full-time and part-time advanced Technical and Polytechnical Institutes where pupils proceed usually from Grade XII to the higher technician level after a few years of special training.

ENTRANCE INTO OCCUPATIONS

Note.—The approximate percentage flow of English and French language pupils, respectively, from the Educational Systems into or from occupations, is indicated by the thickness of the red and green arrows.

EDUCATIONAL LADDER FOR PUBLICLY CONTROLLED FRENCH LANGUAGE SYSTEM

AGES BETWEEN WHICH SCHOOL
ATTENDANCE IS COMPULSORY

EDUCATION in Canada is assigned by the British North America Act to the Provincial Governments and two clearly defined systems have grown up: (1) the English-language Provincial System; and (2) the French-language System of Quebec Province.

The above charts are designed to illustrate these systems and indicate the stages of progress from the lowest grades of the public elementary schools to the highest university levels. Of course, it is a practical impossibility to show in chart form the differences that exist between the separate provincial systems. The aim has been to reduce these to a general pattern. The heavy dotted lines drawn horizontally across the charts indicate the Primary, Secondary, and Higher levels of education, respectively, and the red centre panel with directional arrows shows the stages at which occupational entrance normally takes place.

A significant development in education in all provinces is the growing popularity of evening classes for adults. A wide variety

of subjects is offered, both cultural and practical, and the fees charged are merely nominal. Skilled instructors, in a wide variety of subjects, are engaged and generally speaking the classes are held at the institutions of Secondary education—Technical Schools, High Schools or Collegiates. This movement is shown in the charts by the return arrows (green) from the centre panel to the educational systems at Secondary School level.

The English-Language System.—This is common to eight of the nine provincially organized areas and also to the English-language schools of Quebec Province. Each of these has established standardized Elementary, High School and University grades and a student can move from one Province to another with some degree of assurance that his or her studies can be continued without too severe a break. A recent development in city schools has been the establishment of Kindergartens preliminary to Grade I, these serve as an admirable introduc-

tion to work in the elementary public schools. Many of the English-language provinces have organized French-language schools to meet the needs of French-speaking sections of their population. For instance, in Ontario and New Brunswick there are both English and French schools established under the same broad system.

On paper, the chart of the English-language provinces seems much less complex at the Secondary level than that depicting the educational system of French-speaking Quebec. The contrast is actually not as marked as would appear: the two main types of High Schools in the English-language provinces, viz. (a) the Academic and (b) the Technical and Commercial, offer a variety of courses from which the student may select programs of study (SEE OVER—)

*The Composite High School, as the name indicates, attempts to provide varied courses of study under one roof where a student may select agriculture, arts, home economics or trade subjects, or a combination of these.
In certain provinces graduates from Technical High Schools are permitted to enter Normal School for training as instructors.

AGES BETWEEN WHICH SCHOOL
ATTENDANCE IS COMPULSORY

(CONTINUED FROM CHART)

that are quite as varied as those offered at the more numerous specialized Secondary Schools in Quebec Province. It is often said that in the schools of the English-speaking provinces the accent is placed on pure science, applied science and technology, whereas in Quebec the classical side of education is emphasized. It is near the truth perhaps to say that students in the English-speaking provinces show a marked preference for social and scientific subjects, whereas in French-speaking Quebec the preference is definitely to classical studies. The apparent simplicity of the English-language chart is due largely to the fact that the Secondary High Schools and Collegiates are organized and grouped along standard lines, whereas in the French-language System, it is customary to house specialized courses in separate and independent schools.

At the elementary level there are normally eight grades in the English-language System. The compulsory age limits for attendance at school vary somewhat from province to province (as indicated in the bar diagrams at the sides of the text) but the average period is from seven to fourteen years (to sixteen in Ontario). The curricula are based on standard programs of study drawn up by the various Provincial Departments of Education. Since the Departments of Education are administered by permanent officials, educational policy is also relatively permanent. A capable Deputy Minister or Superintendent of Education can, and often does, impress his personality upon the Provincial System and, of course, under his Minister's direction, administers the payment of government grants for education.

From Grade VIII of the Public Elementary Schools, which is the 'entrance grade', pupils, provided they are not under the compulsory age limit, either graduate into the High Schools or are enlisted into the lower levels of employment in trade and industry. The pupil who advances to High School is now granted a certain latitude in the choice of his courses of study. A particular aptitude may be expressed in the pursuit of technological studies by a male student or a domestic-science course by a female as the basis of his or her life work. The Secondary field of education may extend over any period up to five years: on the other hand, a student may pass from High School into trade and industry at any time during this period, provided he or she is over the compulsory age limit.¹

Education at the highest level is voluntary and specialized and includes all branches of Arts, Commerce, Science, Philosophy, Medicine, Theology, etc. The average period of study before graduation with a first degree (B.A., B.Sc., etc.) is four years, although for Medicine or Theology this period may extend to six or seven years. Post-graduate courses leading to a 'master' degree or a 'doctorate' may take another three or four years.

The English-Language Schools of Quebec Province.—The Roman Catholic English-language schools are under the control of a Roman Catholic Committee of the Council of Education and the curricula follow the general lines of the French Roman Catholic System (see under following heading). The Protestant English-language schools are controlled by a Protestant Committee of the Council of Education. Here the curricula and the general system of education correspond closely to those in the other provinces, except that instead of distinctive High Schools, there are eleven grades. Outside the larger cities all the grades are included in the same building, the four highest being known as High School Grades. From Grade XI

pupils who select the required subjects and obtain the necessary standing in the High School examinations are admitted to McGill or Bishop's College. The compulsory school age is six to the end of the school year in which the child becomes fourteen as in all Quebec schools—English- or French-language—Roman Catholic or Protestant.

The French Roman Catholic School System of Quebec Province.—This is characterized by unique differences which can be traced back to the early history of French Canada. These have persisted in the Roman Catholic School System because they have proved to be particularly suited to the French Canadian temperament and outlook on life. For instance, in the French Roman Catholic Schools the general practice is to keep the education of the sexes separate. From an early age boys follow different programs of studies than those laid down for girls although each program is sufficiently varied to cover all needs. Girls leaving the Primary Intermediate Schools, for instance, may enter the Primary Superior Schools for Girls, or the Girls' Normal Schools, or Regional Household Science Schools. Boys on the other hand may select the Technical Schools, or the Boys' Primary Superior Schools which lead to higher courses of study in the Commercial, Normal, Applied Science and Polytechnical Schools. These Schools give a course equivalent to those of the High Schools and Collegiates of the other Provinces, except for classical studies which are given exclusively in the independent *Collèges Classiques*.

Administration is in the hands of the Department of Education and of the Roman Catholic Committee of the Council of Education. General elementary education is provided by means of a curriculum extending over a preparatory course of seven grades. There is a complementary course of two years study at Primary Intermediate Schools for students who intend to advance to the Technical Schools or through the Primary Superior Schools to Commercial Studies, Schools of Applied Science or Polytechnical and Fine Arts Institutions. A noteworthy distinction in the French-language System as compared with the English-language System is the Normal School training for students who intend to make teaching in the Primary and Secondary fields their life work. In the French-language System, Normal School training extends over a very much longer period than it does in the other Provinces and as already noted Boys' Normal Schools and Girls' Normal Schools are separate institutions. Whereas girls enter normal school training from the Primary Intermediate Schools and take a four-year course, the boys commence normal school training after two years work in the Primary Superior Schools.

A special feature of the French-language System is the *Collèges Classiques*. These feature studies along old-established classical lines. Entrance to them may be gained directly from Grade VII of the Primary Schools and they offer eight years of specialized study. The first year is devoted to elementary classical work; the second to 'Syntax'; the third to 'Method'; the fourth to 'Versification'; the fifth to 'Belles Lettres'; the sixth to 'Rhetoric'; the seventh to Philosophy; and the eighth to Advanced Philosophy. The senior four-years work in the *Collèges Classiques* leads to a baccalaureate degree. In fact, these colleges provide the only channel of entry into university work for the traditional professions, although a boy from a Primary Superior School may proceed with Secondary education at certain recognized institutions to become an architect or engineer by completing a course at a university. The close affiliation of the *Collèges Classiques* with the Universities enables the prescribed course of study for a degree to be covered and the final university examinations to be taken from the colleges.

¹In those Provinces which have Junior High Schools pupils usually enter after completing Grade VI and remain for three or four years after which they graduate to Senior High.

²Or in certain Provinces when the student has passed Grade VIII (whatever his age).

local stations, co-operates with the National Advisory Council on School Broadcasting and with Provincial Departments of Education in the production and arrangement of school programs suitable for broadcasting. (See also p. 336.)

One of the primary objectives of education is the production of good citizens and Departments of Education have kept this before them in the preparation of courses. The arrival of thousands of immigrants in this country has raised problems in post-school education and assimilation which Provincial Departments and local School Boards have taken special measures to meet, usually with the active co-operation of numerous voluntary agencies. Stimulation of national interest in citizenship training, and assistance in the production of booklets and in the exchange of information is given by a voluntary organization known as the Canadian Citizenship Council.

There has been increased interest in the study and improvement of curricula in general, in some cases shown by the appointment of a full-time Director of Curriculum or in others by the action of Curriculum Committees.

Educational Associations.—There are several associations for the promotion of various interests in the field of public education. Among them are the Canadian Education Association, the Canadian Teachers' Federation and the Canadian Federation of Home and School.

The Canadian Education Association is an interprovincial association of educational authorities financially supported by the Departments of Education in the nine provinces of Canada, and Newfoundland. In addition to departmental support, an appreciable number of urban School Boards across Canada also make financial grants to the Canadian Education Association. The Association maintains an office and small staff to act as a clearing house for educational information and as a liaison office on matters of common interest. Two national research projects in education are being sponsored by the Canadian Education Association, one on school health, financed by the Canadian Life Insurance Officers' Association, and the other concerned with the practicality of present secondary-school education for those who do not go on to university training. The latter is financed jointly by industry, labour and retail business.

The Canadian Teachers' Federation established a national office at Ottawa with a full-time Secretary-Treasurer on Jan. 1, 1948. This has permitted better liaison between provincial teachers' federations or associations, and has enabled more emphasis to be placed on matters of general concern to teachers. An important objective is to obtain co-operation and co-ordination of all provincial teachers' organizations on policies and activities of common interest.

The Canadian Federation of Home and School has as its objective a closer liaison between the home and school, and regards the home and school as partners in the education of children. It co-ordinates and stimulates the work of the various provincial home and school federations.

On an international scale the *ad hoc* Canadian Council for Reconstruction through UNESCO, comprised of representatives of many national organizations, carried on a campaign in February, 1948, to aid in the educational, scientific and cultural reconstruction of Europe. The Canada-United States Committee on Education has published, through the C.E.A., a *Study of National History Text Books Used in the Schools of Canada and the United States*, which focuses attention on the existing lack of balance and objectivity in the texts used in the two countries. The Committee is undertaking a somewhat similar study on geography textbooks.

Section 2.—Schools, Colleges and Universities*

This Section summarizes the enrolment in all the educational institutions in Canada which include four types: provincially controlled schools, privately controlled schools, universities and colleges and Dominion Indian schools. The provincially controlled schools are the most important group and account for about 90 p.c. of the total enrolment shown in Table 1. A system of public elementary and secondary education, financed mainly by local school authorities but assisted by provincial grants, has developed in each province. There are private schools in all provinces (i.e., schools that are not conducted by publicly elected or publicly appointed boards and are not financed out of public money) but their enrolment is not large in comparison with that of the public schools. At the level of higher education, there is a provincial university in each of six provinces and one or more colleges supported out of provincial funds in the remaining three provinces. (Agricultural schools and colleges are dealt with at pp. 203-213 of the 1943-44 Year Book.)

* Revised, except where otherwise indicated, under the direction of J. E. Robbins, Director, Education Statistics Division, Dominion Bureau of Statistics.

Teaching Staffs.—The teaching staffs of day schools under provincial control in Canada consisted, in 1946, of 50,344 teachers (38,660 males and 11,684 females). Table 4 gives statistics of rates of salary by provinces, except for Quebec for which

* Day and technical schools only.

comparable data are not available. A separate report, "Teachers' Salaries and Qualifications in Eight Provinces, 1946", deals in detail with the classification of teachers, their teaching experience and rates of salary paid.

4.—Teachers in Provincially Controlled Schools Classified According to Salary, by Provinces, School Year 1945-46

NOTE.—Comparable figures for Quebec are not available.

Financial Statistics.—Table 5 presents a comparable statement of the finances of the Boards operating provincial schools so far as this can be done with existing records.

5.—Financial Support of Provincially Controlled Schools, by Provinces, for Provincial Fiscal Years Ended 1939, 1945 and 1946

NOTE.—The receipts shown in this table do not include any amounts raised by loans or the sale of bonds or debentures, as all revenue of this nature must be repaid ultimately with money raised by local taxation. With the exception of the Maritime Provinces, for which the information is not available, the total net debenture indebtedness of the schools of each province is given annually, thus showing the net increase or decrease per year. Figures for 1914-25 will be found at pp. 985-987 of the 1936 Year Book and those for 1926-44 in the corresponding tables of subsequent editions.

¹ The net figure, after deduction of sinking funds, is given for all provinces except British Columbia, for which the gross figure is given. ² Includes contributions to teachers' salaries in the Maritime Provinces and, in New Brunswick, grants made to schools by the Vocational Education Board. ³ Not available.

⁴ Includes amounts raised by counties and, in Ontario, the township grants on salaries of rural public school teachers. ⁵ Day school grants only. An additional \$86,000 was received for night classes.

⁶ In 1946 school districts were amalgamated into larger administrative units.

Subsection 2.—Private Schools

Private Elementary and Secondary Schools.—Enrolment in private elementary and secondary schools in the eight provinces, other than Quebec, has increased during the past ten years at about the same rate as the total population. In 1938 there were 34,109 pupils enrolled, 8,679 of whom were in residence, while in 1946, 41,363 were enrolled and 12,188 were in residence. Girls were slightly in the majority in 1938 but were about one-third above the enrolment of boys in 1946. In 1938 there were 2,018 teachers, 570 of whom were males and in 1946 there were 2,298 teachers of whom 632 were males and 441 were classed as part-time teachers.

The age of the school population in private schools does not follow the usual pyramid form found in the public schools. It increases regularly from age 6 to age 15 where it is two and a half times as great. Almost 10 p.c. drop out at 16, 25 p.c. of the remainder at 17, 40 p.c. the following year and for ages 19 or over the number is about equal to attendance at age 6. In the publicly controlled schools attendance is at its peak from 9 to 13, then falls rapidly. At age 15 it is considerably below that at age 7 while total enrolment from 16 up is less than at age 7.

The ratio of male to female teachers in private schools in 1946 was about one to three whereas in the the publicly controlled schools it was about one to four.

6.—Enrolment in Private Elementary and Secondary Schools, by Provinces, Specified School Years Ended 1921-46

NOTE.—Figures for intervening years will be found in the corresponding tables of the 1937, 1942 and 1946 Year Books.

Year	P.E.I.	N.S.	N.B.	Que.	Ont.	Man.	Sask.	Alta.	B.C.	Total

¹ Not available.

Business Colleges.—Business colleges in 1938 (exclusive of Quebec) enrolled 18,576 pupils of whom 9,648 were full-time day students, 2,141 part-time day students, and 6,787 evening students. About one-third of the pupils were males. In 1946, enrolment numbered 30,137 including 14,271 full-time, 2,029 part-time, and 13,837 evening pupils. This increase is no more than should be expected considering the increase in population. In 1938, there were 441 teachers and in 1946, 642 teachers. The number of male teachers increased from 133 to 205 during the same period.

7.—Enrolment in Private Business and Commercial Schools (Business Colleges), by Provinces, Specified School Years Ended 1921-46

NOTE.—Figures for intervening years will be found in the corresponding tables of the 1937, 1942 and 1946 Year Books.

¹ Not available.

Subsection 3.—Higher Education

For every 100 pupils enrolled in grade one, there are roughly three in the first year of university. To provide for this small but important percentage of the population, Canada has some 18 universities and a number of other institutions of higher learning. In addition there are some 200 schools of college or junior college status, affiliated with or independent of the universities. About 100 of these institutions in 1944 had a complete degree course and some 19 offered post-graduate work in Arts and Pure Science.

The English-speaking universities are chiefly under-graduate schools although many have provided for the master's degree. Five, of which McGill and Toronto are the largest, accept candidates for the doctor of philosophy degree. Many French-speaking universities offer work for the "license" or master's degree and for various doctorates.

Apart from Arts and Science in 1944 there were some 34 junior colleges and classical schools of Roman Catholic Orders offering courses preparatory to Theology. Other professional schools include 9 colleges or faculties of Agriculture, 5 Architecture,

17 Applied Science and Engineering, 15 Commerce, 5 Dentistry, 13 Education, 4 Forestry, 13 Home Economics, 10 Law, 5 Library Science, 10 Medicine, 10 Music, 15 Nursing, 2 Optometry, 7 Pharmacy, 3 Physical Education, 4 Secretarial Science, 2 Therapy, 2 Veterinary Science and 58 Theology.

Teaching Personnel.—With the influx of ex-service students during 1945-47, the problem of staff became acute. One potential source of teaching personnel was the student veteran group enrolled for post-graduate training. Through co-operation with the Department of Veterans Affairs, a system of part-time teaching was developed for such students to the mutual advantage of university and veteran. The personnel reported for the school years ended in 1944, 1945 and 1946 was as follows:—

<i>Academic Year</i>	<i>Faculties of Arts and Sciences</i>		<i>Professional and Other Schools</i>	
	<i>Full-time</i>	<i>Part-time</i>	<i>Full-time</i>	<i>Part-time</i>
1943-44.....	2,026	489	1,983	2,031
1944-45.....	2,251	463	2,123	1,946
1945-46.....	2,466	1,010	2,645	2,440

Financial Status.—Including the grants made by the Federal Government for the training of student veterans, the resources of the universities were heavily taxed during 1945-47 to meet the necessary expansion of permanent buildings and teaching facilities. Considerable capital expenditure was necessary to overcome the effects of delayed expansion and building projects deferred during the War. The latest available statistics do not include all such expenditures.

Current expenditures increased more than \$7,765,000 in 1945-46 over the previous year for the larger institutions. Colleges and universities responsible for 80 p.c. of the enrolment reported current expenditures amounting to \$25,236,000. About 38 p.c. of this expenditure was covered by Government grants including Dominion and municipal contributions. Student fees represented 38 p.c. of the current income of \$25,592,000 reported by the same group.

The value of land, buildings and equipment advanced about \$5,173,000 over 1944-45 to a total of \$102,627,000. Endowment and trust funds increased \$4,811,000 to a high of \$89,377,000. About 85 p.c. of this amount was centralized in the institutions of Ontario and Quebec.

8.—Statistics of Income and Capital Resources of Universities and Colleges, Specified School Years Ended 1921-46

NOTE.—The larger universities and many of the colleges in Canada are included and represent an enrolment of approximately 80 p.c. of the full-time students of university grade throughout the period. The institutions omitted are mainly those conducted by religious orders where teachers receive little or no salary and the financial returns consequently do not represent a comparable record.

Com. and M. Ed. or M. Paed. ⁷ Includes M.A. Sc., M.S.A., M.Sc.F., M. Arch., M.V. Sc., M. Sc. Dent., M. Surgery (where conferred separately). ⁸ Except diplomas for teachers and theologians.

University Training under the Veterans Rehabilitation Act.*—The Veterans Rehabilitation Act provides for the payment of tuition and other fees as well as an allowance of \$60 per month with extra allowances for dependents for each veteran commencing a regular university course, or course in preparation for university entrance, within fifteen months after discharge. The allowances are paid only while the student is actually at college and are continued, if needed, for as many months as his active service, provided that he makes satisfactory progress. If he fails in a year's work, assistance from the Department is discontinued. A veteran who has failed a year may be reinstated on allowances provided he completes the failed year, or an equivalent year in another course, at his own expense and provided he has shown to the satisfaction of the university concerned promise of successful completion of the course. If a veteran is of scholarship calibre allowances may be continued on a year-to-year basis beyond his period of entitlement, and an outstanding or exceptionally able student may be assisted in post-graduate study when such is in the public interest.

On the recommendation of the Advisory Committee on University Training for Veterans (P.C. 3206, May 3, 1945) legislation was introduced to assist Canadian universities financially in their efforts to provide adequate facilities for qualified veterans. In addition to the regular tuition and other fees the Department of Veterans Affairs was authorized to pay a grant to a university not to exceed \$150 per veteran. The payment of an additional grant was authorized (P.C. 1235, Apr. 1, 1947) for the period July 1, 1946, to June 30, 1947, in accordance with a formula based on the university's statement of current revenue and expenditure.

Authority was also granted (P.C. 4061, Oct. 1, 1946) to the Department to provide any university in Canada with moneys for the purpose of making small loans to meet emergency conditions among veterans being paid allowances pursuant to Sects. 8 and 9 of the Veterans' Rehabilitation Act. Up to Nov. 1, 1947, 373 applications for student veterans' loans amounting to \$102,863 had been approved.

At least 40 p.c. of the veterans wishing to enter university either lacked certain entrance requirements or needed refresher courses. Through the facilities of Canadian Vocational Training, tutorial classes and facilities for approximately 24,000 veterans were organized to meet the needs of such veterans. By the commencement of the 1947-48 academic year all veterans requiring pre-university

* Revised by the Department of Veterans Affairs, Ottawa.

training had completed that training with the exception of 500 who, by reason of illness, late discharge from the Armed Forces, or other good reason, had not been able to commence their training at an earlier date.

The provision of classroom and living accommodation in universities presented a major problem which could be solved only on an emergency basis. At least 25 p.c. of the veterans were married and about 19 p.c. of the unmarried students were living at home. To meet the emergency, a Committee on University Requirements was set up (P.C. 7129, Dec. 4, 1945) and, through the co-operation of the Department of National Defence, the Department of Public Works and War Assets Corporation, temporary facilities were made available to the universities.

Provision was made (P.C. 4161, Aug. 7, 1945) for certain Service personnel discharged overseas to resume or commence special studies, usually at the graduate level, in overseas institutions prior to return to Canada.

To shorten the delay between the date of discharge and that of admission to university, the larger institutions adopted a system of staggered admission dates during the year. In addition to the annual opening date and the summer-school terms, special courses were begun in mid-term, usually January and May, for first- and second-year courses in Arts and Science where the greatest bottleneck was experienced. Three continuous sessions during the year made it possible for some students to shorten the time required to obtain a degree by as much as six months or a year. As the peak of enrolment passed, this system, except in a few cases, was discontinued. It was recognized that the strain on teaching staffs and students alike was too great.

Up to Dec. 31, 1947, some 52,609 primary grants had been made to veterans to enable them to receive university or pre-university training. Approvals for such grants, by provinces, were as follows: Prince Edward Island, 204; Nova Scotia, 2,249; New Brunswick, 1,657; Quebec, 6,635; Ontario, 20,435; Manitoba, 4,597; Saskatchewan, 4,291; Alberta, 3,997; British Columbia, 7,129; and Head Office (training outside Canada), 1,415.

A survey was prepared in mid-November, 1947, to determine the status of veterans who registered in universities at the beginning of the 1947-48 academic year, the results of which are given in Table 10.

Subsection 4.—Dominion Indian Schools*

The administration of Indian affairs by the Indian Affairs Branch of the Department of Mines and Resources is dealt with in Chapter XXX.

Educational work carried on by the Federal Government for the benefit of Indians is now very extensive. In the year ended Mar. 31, 1947, a total of 347 Indian schools were in operation, including 76 residential schools for Indians with an

* Revised by the Indian Affairs Branch, Department of Mines and Resources, Ottawa.

enrolment of 9,304 and 265 day schools for Indians with an enrolment of 10,181 Indian pupils, also 6 combined public and Indian schools with 137 Indian pupils enrolled. The total enrolment of Indian pupils at school increased from 12,799 in 1915-16 to 19,622 in 1946-47; average attendance fluctuated during the period between 62.7 and 82.4 p.c. of enrolment. Continuation and high-school work is taught in several of the day and residential schools. The amount spent on Indian education in the school year 1946-47 was \$2,538,721.

11.—Enrolment and Average Attendance at Indian Schools, School Years Ended 1938-47

NOTE.—Figures for the years 1916-29 will be found at p. 1063 of the 1940 Year Book, and for 1930-37 at p. 929 of the 1942 edition.

¹Includes enrolment and attendance of Indians in combined public and Indian schools.

The enrolment by provinces for the year 1946-47 was as follows: Prince Edward Island, 28; Nova Scotia, 575; New Brunswick, 373; Quebec, 1,648; Ontario, 4,719; Manitoba, 2,742; Saskatchewan, 2,742; Alberta, 2,218; British Columbia, 4,119; Yukon, 200; and the Northwest Territories, 258.

Subsection 5.—Education in the Northwest Territories

The education of the white, native and half-breed children in the Mackenzie District is carried on largely at residential and day schools operated under the supervision of the Federal Government by missions of the Church of England in Canada and the Roman Catholic Church. Located in the principal settlements, these schools were constructed by or with the assistance of the Federal Government, and their maintenance is assisted by annual grants from the same source. In addition, the Northwest Territories Administration furnishes liberal amounts of school supplies and equipment. Residential schools are operated by the Church of England mission at Aklavik, and by the Roman Catholic missions at Fort Resolution, Fort Providence and Aklavik. Day schools are located at Port Brabant, Fort Norman, Port Radium, Fort Smith and Fort Simpson.

A fine modern public and high school building has been completed recently at Yellowknife, and is designed to serve as a school of opportunity for children residing at other settlements in the Territories. The Yellowknife school is the

only one in the Territories maintained chiefly by local taxation and administered by a local school board. A non-denominational school at Fort Smith is maintained by fees and grants. In addition, a day school for Indian children is operated at Fort McPherson by the Indian Affairs Branch of the Department of Mines and Resources.

Public and high school students in remote areas of the Territories have access to correspondence study courses issued by the Alberta provincial educational authorities, and costs in this connection are borne by the Administration.

Eskimo children in the Eastern Arctic are given some education at mission day schools. Because of their nomadic tendency, however, Eskimo seldom remain very long at the settlements and the periods available to the missions for teaching the children are therefore comparatively short. Eskimo children along the Western Arctic Coast and in the Mackenzie Delta attend the mission residential schools at Aklavik. The Eskimo of the Eastern Arctic have mastered a system of syllabic writing (geometric characters similar to a type of shorthand), which most of them can now read and write proficiently. Advantage of this has been taken to provide educational material in the Eskimo language for the benefit both of children and adults, giving advice on health matters, hygiene and native economics. It is planned to provide a measure of teaching service in connection with government nursing stations which are to be established in Eskimo territory in the near future.

Educational matters come under the jurisdiction of the Northwest Territories Council and, on its recommendation, an Inspector of Schools was appointed in 1946. As a result of subsequent inspections made throughout the Mackenzie District, the administration of education in the Territories is being reorganized and new facilities made available. Among the improvements inaugurated recently are an extensive circuit for the regular distribution of educational films and the institution of special school radio programs broadcast to the classrooms. Present plans include the provision of additional equipment and supplies, increased attention to methods of instruction, and the establishment of new day schools in areas where facilities for educational instruction are not as yet available.

PART II.—OTHER EDUCATIONAL ACTIVITIES

Section 1.—The Relationship of Art to Education*

Fine Art.—Fine art appears as an elective subject in the curricula of the Faculties of Arts in a number of universities, where it may be taken as one subject among five for a year or two. In some, e.g., Acadia University, N.S., there are half a dozen or more elective courses. In Mount Allison University, N.B., and in the University of Saskatchewan, there is a sufficient number of courses to allow the taking of a Bachelor degree with specialization in fine art. At the University of Toronto, Ont., an Honour B.A. in Art and Archaeology is offered as well as graduate work in this field. McGill University, Que., opened a Department of Fine Arts in 1947-48.

* Revised under the direction of H. O. McCurry, Director, National Gallery of Canada, Ottawa.

There are also Schools of Art, both English and French, not requiring any fixed academic standing for admission, which concern themselves more exclusively with the technical development of the artist. The most widely known of these are:—

Nova Scotia College of Art, Halifax, N.S.
 Ecole des Beaux-Arts, Quebec, Que.
 Ecole des Beaux-Arts, Montreal, Que.
 School of Art and Design, Art Association of Montreal, Montreal, Que.
 Ontario College of Art, Toronto, Ont.
 Winnipeg School of Art, Winnipeg, Man.
 Provincial Institute of Technology and Art, affiliated with the University of Alberta, Calgary, Alta. (Summer session at Banff, Alta.)
 Vancouver School of Art, Vancouver, B.C.

Courses in these schools vary in length with the requirements of the individual student, but may extend over as many as four years.

Public art galleries and museums in the principal cities perform valuable educational services among adults and children. Children's Saturday classes, conducted tours for school pupils and adults, radio talks, lectures and often concerts are features of the programs of the various galleries. In many cases these institutions supply their surrounding areas with travelling exhibitions, while the National Gallery of Canada carries on a nation-wide program of this nature (see pp. 327-328).

The principal art galleries and museums* are:—

New Brunswick Museum, Saint John, N.B.
 Museum of the Province of Quebec, Quebec, Que.
 Art Association of Montreal and Museum of Fine Art, Montreal, Que.
 National Gallery of Canada, Ottawa, Ont.
 National Museum of Canada, Ottawa, Ont.
 London Public Library and Art Museum, London, Ont.
 Art Gallery of Toronto, Toronto, Ont.
 Royal Ontario Museum, Toronto, Ont.
 Willistead Library and Art Gallery, Windsor, Ont.
 Winnipeg Art Gallery, Winnipeg, Man.
 Saskatoon Art Centre, Saskatoon, Sask.
 Edmonton Museum of Arts, Edmonton, Alta.
 Vancouver Art Gallery, Vancouver, B.C.

Creative Arts.—A development of special interest in the field of the creative arts was the establishment, in December, 1945, of the Canadian Arts Council. The Council grew out of the united action taken by its constituent associations in the spring of 1944, when they presented an integrated series of briefs to the Special Committee of the House of Commons on Reconstruction and Re-establishment. These briefs looked forward to a post-war society in which the arts would be "more widely distributed and more closely integrated with the life of our people". The Council has accordingly taken a very active interest in the development of the Community Centre idea.

The basic situation claimed by the Council is that "in Canada there are millions who have never seen an original work of art, nor attended a symphony concert or a professionally produced play, while in our largest cities thousands of professional creative artists enjoy a field so limited that they are forced into activities unsuited to their talents". Chief among the proposals for remedying the situation is the establishment of "a government body to promote a national cultural program and provide music, drama, art, and film services for all our people". Other proposals have in view the improvement of industrial design, and housing and town planning.

* A complete list of Canadian art museums, societies and schools is included in the *American Art Annual* (New York, 1948).

To list the names of the 16 bodies constituting the Council is to give some indication of the range of professional organization in the field of the arts in Canada:—

The Royal Canadian Academy of Arts
The Royal Architectural Institute of Canada
The Sculptors' Society of Canada
The Canadian Society of Painters in Water Colour
The Canadian Society of Painter-Etchers and Engravers
The Canadian Group of Painters
The Canadian Society of Graphic Arts
The Federation of Canadian Artists
The Canadian Authors' Association
La Société des Écrivains Canadiens
The Music Committee
The Canadian Society of Landscape Architects and Townplanners
The Dominion Drama Festival
The Canadian Handicrafts Guild
The Canadian Guild of Potters
The Arts and Letters Club.

The Role of the National Gallery of Canada.—Founded in 1880 by the Marquis of Lorne, the National Gallery at first served as an exhibition gallery. Provided with an Advisory Arts Council in 1907 and incorporated under a Board of Trustees in 1913, it has assembled its permanent collection largely during the past 40 years. This collection of pictures and sculpture representing the styles of past and present of various parts of the world was assembled for public enjoyment, study and the improvement of arts and industrial products and as the necessary basis for any program of art education. The collection of the National Gallery to-day is of international repute and is accessible to the whole country by means of catalogues, photographs and colour reproductions and to a limited extent by loans. The Canadian section, naturally the most inclusive, is the best available source for the study of Canadian art.

In 1946, the Massey Collection of English Painting was presented by the Right Honourable Vincent Massey, C.H., and Mrs. Massey as trustees of the Massey Foundation. Comprising 75 pictures, the collection makes the National Gallery a leading centre for the study of modern British art, and is the largest gift in the history of the Gallery. Among other recent acquisitions and gifts are paintings by Daumier, Courbet, Whistler, Monet, Pissarro, Cézanne and Gauguin. In 1947 the National Gallery was given charge of the collection of over 4,000 works by Canadian war artists during the Second World War.

The National Gallery carries out a program of extension work throughout Canada. Travelling exhibitions of the art of Canada and other countries are shipped throughout the country under the auspices of the National Gallery. About twenty such exhibitions, including those of the several chartered art societies, are circulated annually. Art galleries and other responsible organizations in various regions draw annually upon the services of the Gallery as the source of most of their offerings to the public. Recent developments have led to the fitting of new community centres into this scheme, and these in turn send exhibits (their own and those from the National Gallery) to smaller communities in their districts. An instance is at London, Ont., where the regional circuit includes Kitchener, St. Thomas, Ingersoll, Chatham and other centres. Loans of pictures from the National Gallery to small or new museums have had much the same beneficial effect as the travelling exhibitions. In these ways actual works of art are constantly being

brought to the attention of the people throughout the entire country and much more may be done if an integrated system of community centres throughout the Dominion develops.

As the latest development in its general educational work the National Gallery in 1946 made a survey of Canadian industrial design and held exhibitions in various cities. A Design Index was established in 1948 as the result of the interest aroused in bringing the design of Canadian goods up to the best international standards and in fostering distinctive Canadian designs.

Other methods of education in the arts apply more specifically to young people and are designed, in part, to supplement regular school work. Thus the Gallery provides material such as written lectures illustrated by lantern slides on all aspects of art history, reproductions of paintings with introductory texts for art appreciation, school broadcasts, classes for school children at the Gallery, exhibitions of children's work, conducted tours of the Gallery's collections and educational demonstrations, public lectures at Ottawa, and lecture tours throughout Canada.

The National Gallery also lends art films including the colour and sound film, *Canadian Landscape*, made in conjunction with the National Film Board and featuring the work of modern Canadian artists against a historical background of landscape painting in Canada since Krieghoff. The silk screen prints by Canadian artists, already famous in many parts of the world as the result of their distribution during the War, are available to schools and the public generally. These and other reproductions are listed in the Gallery's publication, *Reproductions on Sale and Loan Collections*. The magazine *Canadian Art*, in the organization of which the National Gallery took a leading part, is an important channel of information.

Museums and Art Galleries.—At pp. 1025-1026 of the 1939 Year Book a list of the museums (including art galleries) in Canada employing full-time staff is published, showing floor space and average daily attendance of each. There has been no official detailed report published by the Dominion Bureau of Statistics on this subject since 1938.

In 1947 the Canadian Museums Association was formed with the object of aiding in the improvement of the services of museums as educational institutions by promoting co-operation between them, by exchanges with other countries, and by the training and securing of expert staffs.

Section 2.—Scientific and Industrial Research in Canada*

Subsection 1.—Research Facilities

The field of scientific research in Canada is too broad to be covered in detail in each edition of the Year Book but, since the National Research Council is the central national organization for research, a description of the development and work of the Council is given in Subsection 2.

Research work is carried on by the Departments of Agriculture, Mines and Resources, Fisheries, the Board of Grain Commissioners and the Dominion Observatories. These bodies have trained permanent scientific staffs for investigation and research in their own fields such as soil problems, crops, breeding and testing of animals, processing and marketing, extractive and physical metallurgy, silvicultural and forest products, hydrography, ocean and mollusk fisheries, etc.

* Revised under the direction of C. J. Mackenzie, President, National Research Council, Ottawa.

The Board of Grain Commissioners employs a staff of seven chemists and 21 assistants in the main research laboratories for milling, baking, malting, etc., while the Dominion Observatories carry out research in the fields of solar physics, astrophysics, seismology, terrestrial magnetism, gravity and other studies.

Universities often show bold initiative in exploring the field of scientific research but with the limited facilities at their disposal the task of carrying their discoveries to a conclusion is not always easy. Government and industrial laboratories are often able to pick up and carry on where the universities leave off.

A number of Research Foundations have their own special fields of research. The Ontario Research Foundation at Toronto, Ont., established in 1928, is an independent non-profit-seeking scientific organization available to the public and to industry for assistance in matters of a technological character.

The Banting Research Foundation supports the work of the Banting and Best Chair of Medical Research in the University of Toronto and aids medical research throughout Canada.

The Rockefeller Foundation assists various agencies in Canada in the furtherance of scientific research in medical science, natural science, social science and public health.

A detailed account of scientific and industrial research in Canada is given at pp. 970-1012 of the 1940 Year Book. This has been revised to cover developments to 1947 and is available in reprint form from the Dominion Statistician.

Subsection 2.—The National Research Council

Historical.—Organized research on a national basis in Canada dates from 1916 when, at the suggestion of the Government of Great Britain, the Canadian Government established the "Honorary Advisory Council for Scientific and Industrial Researches" under a Committee of the Privy Council. Fifteen members were thus brought together primarily in order that the ingenuity and skill of Canadian scientists in all branches might be brought to bear on the solution of the many urgent problems confronting the Government of that day in the prosecution of the First World War. A secondary purpose was to promote research on peacetime problems of national interest. A survey, made in 1917, showed that industrial research in Canada was practically non-existent and that the supply of men, with such post-graduate training as to enable them to undertake independent investigations, was entirely inadequate to permit of any general application of scientific research to Canadian industrial problems.

Provision was therefore made for the planning and integration of research work and the organization of co-operative investigations; the post-graduate training of research workers; and the prosecution of research through grants-in-aid to university professors. This was the basis of the Council's work from 1916 to 1924.

The Council early recommended the establishment of national laboratories and a Special Committee of Parliament, appointed to study this recommendation, endorsed the proposal after having heard the opinions of many experts. Financial difficulties intervened, but in 1924 public opinion made it possible to have the Research Council Act passed by Parliament. Temporary laboratories were secured and research on the utilization of magnesian limestones for refractories was carried out so successfully that a wartime industry, established during the First

World War, was re-established on a large scale, and has become an important producer of materials that have found world-wide markets. As a result, in 1929-30, the Government provided funds for new laboratories.

Establishment of Laboratories.—The National Research Building on Sussex Street, Ottawa, was commenced in February, 1930, and was opened at the time of the Imperial Conference in 1932. Laboratory divisions were established in applied biology, chemistry, physics, and electrical engineering, and there was a division of research information. In April, 1936, the division of physics and electrical engineering was reorganized and mechanical engineering was established as a separate division. The work of this division continued in temporary laboratories but these quarters soon became inadequate.

Early in 1939 a site of 85 acres, adjacent to the Ottawa Air Station, was secured and 45 acres adjoining this site were transferred to the Council by the Department of National Defence. Plans for the construction of new buildings on this site were made but, as the inevitability of war became more apparent, it was decided to proceed immediately with the construction of only such structures as would have a direct wartime use in dealing with aeronautical engineering problems. Construction of the aerodynamics building was started on Oct. 17, 1939, and later several other buildings were erected. These included the shops and separate laboratories for research on engines, gas and oil, hydraulics, explosives and structures. Wood-working and metal-working shops were also provided. Since then these facilities have been enlarged and extended. New buildings have been provided for engineering and for low-temperature studies.

A résumé of the wartime activities of the National Research Council will be found at pp. 301-302 of the 1947 edition of the Year Book.

Recent Activities.—Three new divisions and several new sections of the National Research Laboratories have been recently established; radar and other kinds of war equipment are being adapted to commercial use; hundreds of investigations are in progress; and the Council is actively engaged in the promotion and correlation of scientific research in all parts of the Dominion.

An Atomic Energy Research Division has been established at Chalk River, Ont., to investigate the applications of atomic energy and the use of its products in industry and medicine. A Division of Medical Research has been organized to stimulate and support investigations in this broad field of human interest. A Building Research Division has been set up to study practical problems relating to construction materials and their use. Work is progressing on the building of a Prairie Regional Laboratory at Saskatoon, Sask., for studies on the better utilization of agricultural surpluses, notably wheat, and farm waste products such as straw. A Maritime Regional Laboratory has been authorized and is soon to be constructed at Halifax, N.S. An Electrical Engineering and Radio Branch has been created to co-ordinate and direct work in this growing field. The activities of the Chemistry Division have been regrouped into two new branches: (1) Fundamental Chemistry, and (2) Chemical Engineering. A Flight Research Section has been established at Arnprior, Ont., in co-operation with the Royal Canadian Air Force. A new section of the Mechanical Engineering Division has been formed to deal with problems in gas dynamics, including work on gas turbines and jet propulsion.

Atomic Energy Research.—In June, 1946, the Dominion Parliament passed the Atomic Energy Control Act. This Act provides means for the development of atomic energy and for the control of work in this field as may be required in the interest of public safety and in the fulfilment of international obligations. A Board of five members was set up to act under the general direction of, and to report to the Chairman of the Committee of the Privy Council on Scientific and Industrial Research. The President of the National Research Council is *ex officio* a member of the Atomic Energy Control Board; other members are appointed by the Governor in Council and hold office during pleasure.

The engineering, construction and operation of the vast plant and townsite at Chalk River, Ont., were carried out by Defence Industries Limited, under contract with the Department of Reconstruction and Supply. As the project developed, both Defence Industries Limited and the Government authorities came to the conclusion that, as the undertaking was really a pilot plant which must be closely integrated with the research laboratories, it would be better if one Government organization were to assume the operating responsibilities of both the research laboratories and the industrial establishments. On consideration of this problem, the Atomic Energy Control Board at its first meeting recommended that the National Research Council be asked to undertake the integration of the various projects and their operation on behalf of and in accordance with the policy of the Atomic Energy Control Board. This was agreed to and on Feb. 1, 1947, the Council took over responsibility for the administration and operation of the entire atomic energy development at Chalk River, and will carry on these activities in accordance with broad general policies fixed from time to time by the Atomic Energy Control Board.

Building Research.—For several years the National Research Council has been engaged in various research projects that have had for their object the improvement of building materials or the betterment of housing construction. Intensive work was initiated some years ago on the requirements for structures and the National Building Code was subsequently published. This is a document designed for use as a model in the drafting of municipal building by-laws. A model zoning by-law was also prepared. Both of these publications have been used extensively as reference works by Canadian municipalities. In 1947 a "Building Code for Smaller Municipalities" was issued that has proved very useful as a residential building code.

The new Division of Building Research provides for the integration of work in this important field and serves as an advisory body to the Central Mortgage and Housing Corporation in all technical activities. Information on building techniques is being assembled as a matter of public service and research projects will be carried out across Canada whenever possible in conjunction with existing research agencies and universities.

Food Research.—In food chemistry much of interest to industry has been done. Work is continuing on refrigerated storage of meats, on processing of liquid and dried eggs, and on dairy products. It has also been found that the baking properties of sugar-egg powders improve as the nozzle size is reduced within practical limits. Considerable progress has been made on the German Fritz continuous butter machine with a view to its adaptation to Canadian requirements. Dried whey has been tested as a component in sponge cakes.

New freezing mixtures have been assessed for use in railway refrigerator cars. Two test shipments of frozen fish, sent from Vancouver to Eastern Canada, showed good results.

Fermentation studies, which earlier produced butanediol from low-grade wheat and surplus crops for use as antifreeze and as a source material for numerous organic chemicals, have been extended. Progress has been made in the fermentation of beet molasses for the production of glycerol. Papers of a glassine or parchment type have been made from several of the cereal straws. A flash-drying unit for processing gluten is currently yielding a product of high quality.

Medical Research.—Most of the activities of the Division of Medical Research will be carried on, as heretofore, in the laboratories of the medical schools and hospitals throughout Canada. In addition to considering applications for grants-in-aid for research and making recommendations to the Council concerning these, the Division, through its Advisory Committee, reports to the Council in respect of medical research fellowships, which were established in 1946. Over \$236,000 was awarded in the form of grants-in-aid by the Division of Medical Research in 1947-48, and 33 medical research fellowship appointments were made. It is hoped that these fellowships, which are open to Canadian medical graduates, will be the means of training young men and women so that their lives may be devoted to research and teaching in the medical schools of Canada.

Radar and Electronics.—In radar and electronics substantial contributions have been made. In harbour control, the original installation was made at the Naval Signal Station located at Camperdown, N.S., overlooking the entrance to Halifax Harbour. Since then, a nine-inch display with accurate ranging facilities has been added. The design of a second antenna has been completed. Procedures are being worked out for the use of shore-based radar in the identification and guidance of incoming ships that are not equipped with radar. Merchant marine radar equipment provides assistance to navigation in restricted waters and serves to give anti-collision warnings. A small low-cost ship-borne radar set has been designed for the use of merchant shipping. Trials during 1947 showed that blind navigation of the entrances to Toronto harbour and identification of every wharf within the harbour is possible. Great interest has been shown by lake navigators in the specially fitted motor vessel "Radel" during operations on Lake Ontario off the Scarboro Field Station. Demonstrations of the usefulness of radar are arranged from time to time for the benefit of ship owners and navigators.

A direct-reading electronic instrument, designed to locate hot joints on power lines, has been given extensive field tests that have demonstrated its practical value. Comparison has been made of the pulse method and the resonance method used to locate faults in electric power cables.

Physics.—In the Division of Physics many practical problems have been studied and fundamental work has been done in several fields.

Magnetometer surveys were carried out during the latter part of 1947 in co-operation with the Department of Mines and Resources and with the assistance of the Royal Canadian Air Force. The magnetometer, trailed by a cable behind an aircraft, records the changes in the earth's magnetic field as the aircraft passes over the land to be surveyed. The results, automatically recorded in the aircraft, provide the data for accurate topographic maps and indicate the location of mineral

areas. A recording radar altimeter has been developed that will greatly expedite contouring in the preparation of topographical maps, and hence will be a valuable aid in surveying.

A new rod thermostat is being developed for use in railway refrigerator cars. Sensitivity of 1.3°F . has been secured under semi-operating conditions but further work is required before it can be adapted to commercial use.

Radiant panel heating and panel cooling investigations were carried out during the year.

Chemistry and Chemical Engineering.—A co-operative research with Noranda Mines Limited has had for its object the development of a method of roasting pyrite for the recovery of elemental sulphur. Indications are that this process can be carried to the commercial stage in the near future. A study is in progress on the direct reduction of iron sulphides of which large tonnages are being mined in Canada for both gold and base-metal recovery.

The rain repellent for aircraft wind screens, which was developed in the Council's laboratories, is becoming widely used and its commercial production is expected to begin in the near future. Action of inhibitors in water and antifreeze systems is being investigated, and work has begun on the study of corrosion at high temperatures.

The textile research laboratory is now providing members of the Canadian Institute of Launderers and Cleaners with a technical service mainly for control of the laundering and cleaning efficiency of commercial plants.

The rubber laboratory has undertaken an investigation into the correlation of laboratory abrasion tests with actual road tire tests to provide information in regard to slipping or holding of tires on icy roads. Some forty samples of rubber of different compositions have been tested over a wide range of temperatures to determine their frictional properties.

Work has continued on the chemistry of certain fatty acids present in drying oils with the object of increasing their usefulness in paints or of producing drying oils from more readily available materials.

A lubrication problem of considerable industrial and scientific interest on which work is proceeding, relates to the lubrication of railway car journals.

A new and very rugged catalyst has been developed for use in the determination of carbon monoxide by direct oxidation. An improved continuous carbon monoxide recorder using this catalyst has been designed.

Mechanical Engineering.—The National Research Council has two model-testing basins, fully equipped for work on seaplane floats, ships' hulls, etc. From towing tests, the power required to propel a full-scale hull at any given speed, or the speed obtainable from a given engine installation, can be accurately estimated.

A large portion of the work in the aeronautics section is devoted to the wind-tunnel testing of new aircraft designs for Canadian firms. At the Flight Research Station at Arnprior, Ont., in co-operation with the Royal Canadian Air Force, more than 250 hours flying were undertaken on research projects during the year. In one investigation, a wake-rake was installed behind Frise ailerons of various contours on a Harvard aircraft and the boundary layer at the trailing edge over a range of aileron angles was measured using an automatic observer.

With a specially equipped experimental aircraft, the low-temperature laboratory has continued the flight investigation of aircraft icing, electro-thermal de-icing for wings and propellers and the study of meteorological conditions associated with ice.

In co-operation with the Meteorological Service of the Department of Transport, a snow-cover survey has been initiated to obtain data on the type and condition of snow encountered in different parts of Canada for use in the development of snow-clearing equipment and the study of other subjects, such as aircraft skis, associated with winter transportation.

The tailless glider has been modified to incorporate fighter-type cockpit canopies and further wind-tunnel tests have been carried out. Flight tests at Edmonton, Alta., during 1947, were interrupted early in the season by an accident to the glider.

Work continues on the improvement of fuels and lubricants for low-temperature use and includes observation of the performance of fuels and lubricants under cold-weather conditions at Churchill, Man., and the study of low-temperature lubrication problems for the Armed Services.

In co-operation with the Department of National Defence, road tests have been made to determine the limit of sulphur which can be tolerated in gasoline without harmful effects to motor-vehicles. This has become a problem because of the higher sulphur content of presently available crude oils. Research on fuels and combustion in jet engines has been initiated. A comprehensive theoretical and experimental investigation of turbine icing was begun in 1947.

Provision of static equipment for the testing of full-scale aircraft components was begun during the year and is nearing completion.

Work is being continued on the study of wing flutter, stressed shells, stresses in ski undercarriages, and prostheses.

Relations with Industry.—Problems suggested to the Council that are deemed of national interest may be undertaken entirely at the Council's expense. In other cases, when a company has an interest in a project, arrangements can be made on a mutually satisfactory basis whereby the expense of the research is shared by the company and the Council. In exceptional cases, especially when facilities for a given investigation are not available elsewhere in Canada, the Council may undertake a specific piece of research for an industry on a fee basis in which case the results become the property of the company requesting the information. From this it will be seen that each problem presented to the Council is considered on its merits and dealt with in what seems to be the most efficient and practical way.

An important service to industry is being rendered by the Council through the Technical Information Service. This organization, now carried on under the National Research Council, was established in the Department of Reconstruction and Supply as a means of bringing to the attention of Canadian industry the important scientific advances made in manufacturing processes and the uses of new materials. The smaller industries in particular have found the Service of great value.

Section 3.—The Educational Functions of the National Film Board and the Canadian Broadcasting Corporation

The National Film Board.*—Since the beginning of the Second World War, Canada has seen a great advance in the use of films in education, both formal and informal, for adults as well as children. The National Film Board has contributed very largely to this development. It has produced and distributed more than a thousand informational films, made available to Canadian schools and adult organizations some of the better films produced in other countries, assisted in the establishment and servicing of close to 150 film libraries and depots, provided film programs regularly to several thousand rural communities, and assisted in making educational films available to hundreds of thousands of Canadian school children. In all of these activities the Board has worked closely with Provincial Departments of Education, national and provincial organizations engaged in educational work, and community organizations of all kinds. The object has been to assist all educational agencies to obtain and use visual material to strengthen their educational programs, as well as to bring to the largest possible section of the Canadian public those films that interpret Canadian and world affairs.

Film Libraries.—In Canada, the backbone of urban 16mm distribution is the film libraires that have been established throughout the nine provinces by the Board and by local bodies such as public libraries, normal schools, provincial Departments of Education, university extension departments and, more recently, community film councils. The majority of Canadian communities with populations of more than 5,000 now have their own film libraries which numbered 158 by the end of 1947. Nearly 200 Film Councils and local film committees assist in encouraging the use of informative and educational films in the community.

Special Educational Services.—Special services have been developed for industry, women's organizations, scientific and engineering groups, health and medical bodies, and in other specialized fields such as education, science, welfare, reconstruction and housing to assist in building approved programs of films and other materials for all interested organizations. To serve their film needs, the Board maintains at Ottawa a Preview Library of 2,500 titles.

Rural Film Circuits.—Rural areas which lack projectors and film libraries are served with monthly film programs by the Board's rural circuits. An increasing number of circuits are operated in co-operation with farm organizations and provincial and local governments. The careful planning of the rural film programs, together with discussion booklets for teachers and group leaders, relate them closely to the work and interests of the communities they serve. Each Rural Circuit reaches about 20 locations each month bringing a program in the afternoon to school children and in the evening to general audiences. Films are chosen for the value and interest of the information they contain. The program for schools is chosen in consultation with the Department of Education in each province. Many thousands of Canadian school children have had their first opportunity to see educational films regularly through the Film Board's rural circuits. Through their co-operation with farm organizations, extension departments of universities, and Provincial Departments of Education, Health, and Agriculture, the Board's rural representatives have come to be regarded as valued servants of the community.

* Prepared under the direction of Ross McLean, Film Commissioner, National Film Board, by Stanley Rands, Co-ordinator, Research and Reports. The non-educational services of the National Film Board are outlined in Chapter XXXI on Sources of Official Statistical and Other Information Relative to Canada.

Education by Radio.*—The Canadian Broadcasting Corporation devotes a good share of its broadcast time on the English- and French-language networks to programs of an educational nature both for children and adults. Whenever possible, education and entertainment are combined.

School Broadcasts.—The CBC co-operates with all nine Provincial Departments of Education in Canada in broadcasting special programs related to the courses of study conducted in school classrooms. School broadcasts for French-speaking listeners in Quebec are heard under the title *Radio-College*.

In addition to the provincial broadcasts, the CBC itself prepares and finances a series of *National School Broadcasts* heard in classrooms from coast to coast. These are produced with the advice of the National Advisory Council on School Broadcasting, consisting of representatives of each of the Provincial Departments of Education, the Canadian Teachers' Federation, the Canadian Federation of Home and School, the Conference of Canadian Universities, and the Canadian Trustees' Association. The aim is to increase students' knowledge of Canada, and their consciousness of her achievements and responsibilities. Particulars of all school broadcasts available in Canada are contained in the manual *Young Canada Listens*, published each year by the CBC, and of which some 40,000 copies are circulated to teachers and educational authorities.

In the 1947-48 season, the 27 *National School Broadcasts* prepared by the CBC presented a series of Canadian legends in dramatic form; dramatized stories of Hudson's Bay Company men whose careers contributed to the development of the Canadian Northwest; actuality broadcasts picturing Canadians at work on wheat farms, in plywood mills, shipyards, and mines; dramatized stories based on the lives of four Canadian poets; three broadcasts designed to increase understanding of free political institutions in a democracy; and a complete presentation of Shakespeare's *Hamlet*, broadcast in six instalments, with leading radio actors in the various roles and with a specially composed music score.

Several programs were exchanged with the *American School of the Air*, produced by the Columbia Broadcasting System in the United States. One full week of the *American School of the Air* series was devoted entirely to programs from Canada.

A new development during the year was the provision of CBC educational programs for children in the Mackenzie District of the Northwest Territories, for many of whom there are no schools available. At the request of the Department of Mines and Resources, responsible for education facilities in the Northwest Territories and Yukon, a number of CBC school programs were broadcast by the Canadian Army radio station at Aklavik. The Department provided battery-powered radio receivers to schools not equipped with sets, and the CBC supplied recordings of educational broadcasts required by the Department.

As in previous years, each of the CBC's *National School Broadcasts* was preceded by a ten-minute review of the leading news event of the week, specially prepared for young listeners by the CBC News Service.

Adult Education.—Programs of an adult educational nature are presented on all CBC networks in a variety of forms and on a wide range of subjects including national and international affairs, political broadcasts, business and labour interests,

* Revised under the direction of Dr. Augustin Frigon, C.M.G., General Manager, Canadian Broadcasting Corporation, Ottawa. The non-educational services of the CBC are outlined in Part VII, Sect. 3 of Chapter XIX on Transportation and Communications.

women's interests, community activities and social problems, literature and creative writing, science, nature and sports. *Citizens' Forum*, a discussion program originating at public meetings, and already in its fifth year on the air, became a part of *CBC Wednesday Night*, a new venture in Canadian radio programming in which Wednesday nights on the CBC Trans-Canada network are devoted entirely to programs that are stimulating, substantial, and more demanding on the attention of the listener.

Citizens' Forum is produced in co-operation with the Canadian Association for Adult Education, which has organized about 500 listening groups across the country. This Association, with the Canadian Federation of Agriculture, helps in the preparation of another CBC series, *National Farm Radio Forum*, on which farmers from all parts of Canada are able to exchange views and discuss their problems. Now in its eighth year, *Farm Radio Forum* is followed each week by more than 1,300 listening groups throughout rural Canada. Both of these discussion programs have their counterparts on the CBC French network.

In order to present commentaries on the European scene, the CBC maintains an Overseas Bureau with headquarters at London, England.

Special programs for women, in both English and French, offer practical information on household problems, citizenship, community organization, vocational guidance, housing and the needs of the aged.

Music and Drama.—Regularly scheduled symphonic concerts were continued during the 1947-48 season, and many young Canadian musicians were introduced to a national audience in CBC recital series. Music appreciation was fostered by special music programs for children. In November, 1947, a nation-wide audience heard the world premiere of a Canadian symphonic suite in five movements, by Alexander Brott, commissioned by the CBC International Service in the interests of promoting Canadian music both at home and abroad.

Canadian writers produced by far the greatest number of dramatic presentations heard on both English- and French-language networks. Significant productions by other than Canadian writers included the first Canadian radio performance of T. S. Eliot's play *Murder in the Cathedral*, and a two-part performance of Ibsen's *Peer Gynt*, with the incidental music by Edvard Grieg, both broadcast on *CBC Wednesday Night*.

Programs for Pre-School-Age Children.—The 1947-48 season saw the beginning of an experimental series of programs for pre-school-age children, called *Kindergarten of the Air*, a joint project of the CBC, the Toronto Junior League, the Canadian Federation of Home and School and the Federated Women's Institutes of Canada. The programs are designed to give children in isolated rural areas creative stimulus to help them develop constructive play, observation and self-help and to serve as a pattern and guide to mothers in playing with and teaching their own children.

Section 4.—Libraries

The Dominion Bureau of Statistics publishes biennially a Survey of Libraries in Canada listing public, university, government, and other special libraries and showing the location, size, etc., of each. The latest report issued is the Survey for 1944-46 covering library service in 1945; the information in that report is synopsized at pp. 307-313 of the 1947 Year Book.

Section 5.—Canada and UNESCO*

The origin of the United Nations Educational, Scientific and Cultural Organization and its activities up to the First Session of the General Conference (held in Paris in November, 1946) were described at pp. 313-315 of the Canada Year Book 1947.

The Second Session of the General Conference was held at Mexico City, Nov. 6 to Dec. 4, 1947. Delegations from 37 countries participated; there were official observers from 12 countries and about two dozen international organizations. Altogether 125 delegates, 174 experts or advisers, and 56 observers were present, including a Canadian delegation of 11 persons.†

The program for 1948, as approved by the Mexico Conference, called for a budget of \$7,682,637, of which Canada is expected to contribute 3·7 p.c., or approximately \$286,500, apart from a contribution of like proportion to a Revolving Fund of \$1,000,000.

Reconstruction.—In addressing the Conference the Chairman of the Canadian Delegation said: "The needs of reconstruction in countries devastated by war must be given the strongest possible emphasis, for, until all the cultural, intellectual, and scientific resources of the devastated countries are brought into play, the activities of UNESCO in other fields must inevitably lag". There was general agreement with this point of view. The Reconstruction Division of the Secretariat was given a budgetary appropriation of \$614,141 including \$178,000 for emergency grants-in-aid, but intended primarily to enable it to collect and disseminate information on needs, and to stimulate action on the part of national and international bodies to meet those needs.

At the time of the Conference a national campaign by voluntary organizations in the United States had succeeded in raising more than \$100,000,000 for reconstruction through UNESCO. A corresponding Canadian organization, the Canadian Council for Reconstruction through UNESCO, was being organized. Its campaign for funds, jointly with the United Nations Appeal for Children, was launched in February, 1948, with a combined objective of \$10,000,000.

To assist the Reconstruction Division, UNESCO provides office facilities at Paris for a Temporary International Council for Educational Reconstruction (TICER), on which there are representatives of 21 international voluntary organizations. UNESCO helps the individual organizations in the operation of youth camps, and in other ways.

Education.—In carrying out the program in education for 1948 the Director General was instructed by the Mexico Conference to give first and equal priority to the following seven projects: (1) fundamental education; (2) adult education; (3) work with universities; (4) educational seminars; (5) education for international understanding (in primary and secondary schools of Member States, including essay competitions for young people); (6) improvement of text books and teaching materials; and (7) consultative educational missions to such Member States as request them.

The results of the seminar for teachers, held near Paris in the summer of 1946, were particularly well received by the Second General Conference. It was proposed to hold three of world-wide scope in 1947 (at Prague, London and New

* Prepared by John E. Robbins, Director, Education Statistics Division, Dominion Bureau of Statistics, in collaboration with the Department of External Affairs.

† A report of the Canadian Delegation to the Second Session of the General Conference of UNESCO (53 pp. mimeographed) is available from the Department of External Affairs, Ottawa.

York, as later arranged), and one regional Latin American seminar. Canada was asked to nominate two educators to participate in each of the three.

The 1948 budget makes provision for a world conference of university representatives in the hope that an international association of universities may be established. It also provides for a world conference of leaders in adult education. The Canadian Association for Adult Education invited UNESCO to hold this latter conference in Canada, but it is to be postponed until 1949.

Communication.—The program under the general heading of Communication includes exchange of persons, mass media (press, radio and film), libraries, etc.

The Exchange of Persons Bureau in the Secretariat has some money at its disposal for fellowships, but its main function is that of a clearing house for information. Fifty-two fellowships out of UNESCO funds, to students in war-damaged countries, were announced early in 1948, and a larger number provided by Member States or national or international organizations were put at the disposal of UNESCO for allocation. Other bodies awarding international fellowships on their own account relied heavily on the Bureau for information.

The study of technical needs and removal of obstacles to the free flow of information in mass media are being continued. In addition a production unit is being organized capable of initiating and influencing production in press, radio and film within the field of UNESCO interests.

Various efforts are being made to increase the understanding and use of public libraries, the improvement of bibliography, and the production of low-priced books, and to improve copyright law on a world-wide basis.

Cultural Interchange.—Assistance is being given to the International Theatre Institute established in 1947, and efforts are being made to establish an International Music Institute. The scope of the International Pool of Literature is being extended. The distribution of reproductions of national works of art is being facilitated. Plans for organized exchanges of exhibitions and collections between the museums and galleries of different countries are being developed. The establishment of an International Council of Associations concerned with philosophy and the humanistic studies is to be assisted.

Human and Social Relations.—The chief concern of the Social Sciences Section of the Secretariat in 1948 is the organization of studies under the general heading of Tensions Affecting International Understanding. The interest and assistance of social scientists in universities of the various countries is being enlisted. A major concern of the Philosophy Section is an analysis of current ideological conflicts.

Natural Sciences.—The Natural Science Section of the Secretariat in 1947 established Field Science Co-operation Offices in the Middle East, the Far East and Latin America, and planned to establish a fourth in South Asia in 1948. The purpose is to facilitate two-way communication between the scientists of these areas and of Europe and North America.

International scientific collaboration is also being furthered by means of grants-in-aid and other forms of assistance to international scientific and technological organizations. There is close collaboration with the International Council of Scientific Unions. The organization of an International Institute of the Hylean Amazon was expected in 1948 on the initiative of UNESCO, to be financed largely by governments in northern South America.

CHAPTER X.—AGRICULTURE

CONSPECTUS

		Subsection 12. International Agricultural Statistics.....	400

Agriculture, including stock raising and horticulture, is the most important of the primary industries of the Canadian people, employing, according to the Census of 1941, 25·2* p.c. of the total gainfully occupied population and 30·5* p.c. of the gainfully occupied males. In addition, agriculture provides the raw materials for many Canadian manufactures, and its products in raw or manufactured form constitute a very large percentage of Canadian exports. For a statement of the occupied and the available agricultural lands in Canada, see pp. 28-29 of this volume.

An introductory outline of the historical background of Canadian agriculture is given at pp. 187-190 of the 1939 Year Book.† The present Chapter treats of current governmental activities and includes comprehensive statistics of agriculture, such as: farm income, values of agricultural production and farm capital, field crops, farm live stock and poultry, dairying, fruit, special crops, prices and miscellaneous statistics. World statistics of agriculture, formerly compiled from the publications of the International Institute of Agriculture, were not available for recent editions of the Year Book because of war conditions but at pp. 400-403 statistics of grain production for world countries are again introduced.

Section 1.—The 1947-48 National Agricultural Program and Policy‡

Canadian agriculture began the year 1948 in a strong financial position. Farm debt had been reduced, cash income and net income increased and large quantities of new equipment had been acquired.

Production Programs

During the war years, 1939-45, production programs were formulated annually at conferences between Dominion and Provincial Departments of Agriculture, along with representatives of organized farmers. These conferences were found to serve such a useful purpose that they are being continued annually. Recommendations

* Including persons on Active Service normally employed in agriculture.

† See list of reprints under "Agriculture", at the front of this edition.

‡ Prepared under the direction of G. S. H. Barton, C.M.G., B.S.A., D.Sc.A., Deputy Minister of Agriculture, Ottawa.

for Canada's 1947 agricultural program were discussed at a Dominion-Provincial Conference in Ottawa, on Dec. 2, 3, and 4, 1946. This was the 14th Agricultural Conference held since the outbreak of war in 1939 and the 5th annual conference convened under the auspices of the Agricultural Supplies Board. The major problem under consideration was the distribution of Canada's agricultural land resources in such a way as to provide for the optimum production of major grain crops needed for human food and live-stock feeding. At the Conference held in December, 1947, to discuss production for 1948, it was generally agreed that the over-all production reached in 1947 was a basic position which could well be maintained in 1948. In his address to the Conference, Rt. Hon. James G. Gardiner, Federal Minister of Agriculture, suggested that the time had probably come when no attempt should be made to establish objectives for individual commodities, as had been done in the past. Rather, it was the opinion of the Federal Department of Agriculture, that a general program should be agreed upon, and the Provincial Governments and farmers within the provinces would then be in the best position to propose changes in acreages based upon marketing possibilities as they developed.

Contributing to the present high level of farm output are greater and improved farm mechanization; greater use of fertilizers and lime; more general use of improved varieties of crops—higher yielding, earlier maturing, insect or disease resistant varieties; and improved breeding and feeding of live stock and poultry.

Farm Income

Changes in the kind of agricultural production during and since the Second World War, in the nature and volume of domestic and export demand, and changes in farm prices have resulted in greatly increased cash and net farm income. Cash income received by Canadian farmers from the sale of farm products and from supplementary payments during 1947 amounted to \$2,002,195,000 (see Table 3, p. 354) which exceeded the 1946 figure by \$232,563 or 13.1 p.c.

Post-War Subsidy and Price Policy

As reported in the 1947 edition of the Year Book, most of the agricultural subsidies administered by the Department of Agriculture in 1946 and early 1947 were eliminated. Effective Oct. 22, 1947, the subsidy of 25 cents per bushel on wheat and barley, and 10 cents per bushel on oats—when these grains are used for live-stock feed—were discontinued and price ceilings were removed. At the same time, the grain grower was protected by the establishment of a floor price at which the Canadian Wheat Board is prepared to purchase wheat, oats and barley. At the end of 1947, the principal agricultural items remaining under price control were wheat, flax and sunflower seed. In order to protect the producers of meat, dairy and poultry products, however, virtually all feed grains and live-stock feeds remain subject to export control.

With the removal of ceiling prices and subsidies on feed grains, and ceiling prices on feedstuffs, these commodities advanced in price and live-stock farmers experienced a corresponding increase in their costs of production. This was offset by the removal of the domestic ceiling prices on meats and the negotiation at a higher price of the contracts with the United Kingdom for bacon, beef, cheese and eggs.

Under these circumstances it was not necessary to draw upon the provisions of the Agricultural Prices Support Act, 1944, and place a support price under any of the chief agricultural commodities. This Act provides for the support of agri-

cultural prices during the transition from war to peace. However, the inability of the United Kingdom to purchase any fresh apples from Canada in 1947, presented marketing difficulties to Nova Scotia apple growers whose traditional export market is in the United Kingdom. In order to promote orderly marketing and to provide a stable price for the growers, the Agricultural Prices Support Board guaranteed a return per barrel of \$2.00 to \$2.25 according to the percentage of culls. The Nova Scotia Apple Marketing Board as agents for the growers, will market the apples to best advantage, and if returns from all sales yield an average price per barrel less than the guaranteed minimum the Board will make up the difference.

United Kingdom Contracts.—The food contracts with the United Kingdom, which developed out of the necessity of war, are at present an important part of the Government's program to maintain price stability of agricultural products. While providing a fixed price for the exportable surplus of the principal farm products, these contracts also act as a floor above which domestic prices find their level.

The new contracts, negotiated early in 1948, are for Canada's surplus of beef, bacon, eggs and cheese for the years 1948 and 1949 to an actual quantity previously estimated each year and written into the contracts. While the prices for 1948 have been agreed to, the prices for 1949 will be negotiated before the end of 1948 and will maintain a proper relationship with grain prices at that time. The contracts for 1948 are as follows:—

Bacon.—The contract for the calendar year 1948 is for 195,000,000 lb. of bacon and ham at \$36 per 100 lb. Grade A No. 1 sizeable Wiltshire sides, at seaboard. The comparable price for the 1947 contract was \$29.

Beef.—The contract for the calendar year 1948 is for an estimated 45,000,000 lb. Prices are: Red Brand \$27.50 per 100 lb., Blue Brand \$26.50 per 100 lb., Commercial \$23.10 per 100 lb. at seaboard. The price increase over the 1947 contract varies from \$3.25 per 100 lb. to \$1.50 per 100 lb. according to quality.

Cheese.—The contract for the 12 month period beginning Apr. 1, 1948, is for 50,000,000 lb. at 30 cents per lb. first grade f.o.b. factory shipping point. This represents an increase of 5 cents per lb. over the preceding contract price.

Eggs.—The contract for eggs is for the year ending Jan. 31, 1949, for 80,000,000 dozen. The price is based on Grade A Large, delivered seaboard; spring price 47.5 cents per dozen, autumn 54.25 cents per dozen, storage 52.75 cents per dozen. The spring price (late January to Aug. 31) represents an increase of 5 cents per dozen, and the autumn price (Sept. 1 to late January) an increase of 3.5 cents per dozen over 1947 contract prices.

Wheat.—Canada has entered into a contract with the United Kingdom covering a period of four years, commencing Aug. 1, 1946, for the delivery of specific quantities of wheat. Quantities covered by the contract are 160,000,000 bu. for each of the first two years, 1946-47 and 1947-48, and 140,000,000 bu. for each of the last two years of the agreement. Within the total quantities, provision is made for minimum amounts of flour to be included. The price, basis No. 1 Northern in store at Fort William, Port Arthur, Vancouver and Churchill, is \$1.55 per bu. during each of the first two years; prices for each of the third and fourth years are to be negotiated, but, in any event, will not be less than \$1.25 per bu. for the 1948-49 crop year, and \$1 per bu. for the crop year 1949-50. The contract is subject to modification to conform with any international agreement entered into subsequently and to which both Governments are party.

The Agricultural Products Act.—To enable the Federal Government to fulfil its obligations under the food agreements and also to export food supplies to distressed countries, Parliament, in the spring of 1947, passed the Agricultural Products Act. Under this Act, the Minister of Agriculture may sell or export agricultural products and establish commodity boards vested with the necessary regulatory powers. This Act is on an annual basis but may be continued in force for further 12 months periods with the approval of Parliament.

Section 2.—Government in Relation to Agriculture

It is provided in Sect. 95 of the British North America Act that "in each province the legislature may make laws in relation to agriculture in the province"; it is also declared "that the Parliament of Canada may from time to time make laws in relation to agriculture in all or any of the provinces; and any law of the legislature of a province relative to agriculture—shall have effect in and for the province as long and as far only as it is not repugnant to any Act of the Parliament of Canada". As a result of this provision, there exists at the present time a Department of Agriculture, with a Minister of Agriculture at its head, in Canada and in each of its nine provinces.

Subsection 1.—Canada's Relationship with FAO*

Canada has continued to take an active part in the work of FAO. The Third Session of the Conference of the Food and Agriculture Organization of the United Nations was held in Geneva, Switzerland, from Aug. 25 to Sept. 11, 1947. The outstanding single action of the Conference was the approval of the Report of the Preparatory Commission on World Food Proposals and the creation of a Council of FAO, popularly known as the World Food Council. This Council is made up of official representatives of eighteen Member Governments and has an independent Chairman appointed by the Conference. It will meet at intervals between annual sessions of the Conference to keep the world food and agriculture situation under constant review and to recommend national and international action as required. It will also exercise general supervision over FAO administration and policy, replacing the FAO Executive Committee.

In selecting members of the Council, consideration is given to the inclusion in the membership of a balanced geographical representation of nations. Members of the Council are to be elected for three years but, in the initial term, one-third are to serve for one year, one-third for two years, and one-third for three years.

The most serious problem confronting the newly formed Council is the current food shortage. In accordance with the recommendation of the Geneva Conference the task of international allocation of scarce foods and supplies has been assumed by FAO. The International Emergency Food Council has been dissolved and its functions, organization and staff transferred to a new International Emergency Food Committee of the Council of FAO. The Geneva Conference found that the serious food deficit which had been forecast previously had been greatly accentuated as a result of hazardous weather and the deterioration of crops in many parts of the world.

* For details of first and second Conferences of the Food and Agriculture Organization see pp. 206-211 of the 1946 Year Book and pp. 329-330 of the 1947 Year Book.

Other developments in FAO designed to facilitate the objectives of the Organization include the establishment of regional offices, the setting-up of a Technical Co-ordinating Committee and the continuance of activities in the various technical fields, including the despatch of missions to those countries requesting such assistance.

Subsection 2.—The Federal Government*

Farm Credit

The Federal Government has set up several agencies to handle the matter of farm credit; the Farm Loan Board is empowered to make long-term loans to farmers† and the chartered banks, under the Farm Improvement Loans Act, to provide intermediate and short-term credit.

The Canadian Farm Loan Board.‡—This Board was appointed by the Governor in Council under the provisions of the Canadian Farm Loan Act (c. 66, R.S.C. 1927, as amended by c. 46, Statutes of 1934 and c. 16, Statutes of 1935) and, as an agency of the Crown in the right of Canada, administers a system of long-term mortgage credit for farmers throughout the country. The Board commenced its work in 1929 and since 1935 has carried on lending operations in all provinces.

The Board lends money to farmers to pay debts, purchase live stock and farm equipment, assist in the purchase of farm land, make farm improvements and for any other purpose considered as improving the value of the land for agricultural purposes.

Loans are made on the security of first mortgages on farm lands actually operated by the borrower up to an amount not exceeding 50 p.c. of the appraised value of such farm lands and not in excess of \$5,000; such loans are repayable on an amortized plan over periods up to twenty-five years.

Further advances by way of second mortgage may be made to first mortgage borrowers who require additional funds. The amount of such additional advance is not to exceed 50 p.c. of the first mortgage loan, nor the aggregate of first and second mortgage loans to exceed two-thirds of the appraised value of the farm land mortgaged nor, in any event, an aggregate of \$6,000.

The interest rate on loans made on or after Apr. 2, 1945, is 4½ p.c. on first mortgage and 5 p.c. on second mortgage. The interest rate on loans made prior to Apr. 2, 1945, is 5 p.c. on first mortgage and 6 p.c. on second mortgage.

Particulars of the capital requirements of the Board and other details appear at p. 185 of the 1940 Year Book.

From the commencement of operations in 1929 to Mar. 31, 1947, the Board made 27,875 first mortgage and 8,995 second mortgage loans for a total amount of \$57,543,717 disbursed. Of that amount, \$34,100,122 has been repaid. At Mar. 31, 1947, the principal assets of the Board amounted to \$22,909,897·93 made up as follows: 15,032 first mortgage loans, \$21,837,256·27; 1,231 second mortgage loans, \$549,094·09; 337 sale agreements, \$478,110·10; 23 parcels of real estate, \$45,437·47.

* Except as otherwise indicated, this material was prepared under the direction of G. S. H. Barton, C.M.G., B.S.A., D.Sc. A., Deputy Minister of Agriculture, Ottawa.

† In addition to the credit supplied by the Canadian Farm Loan Board, and in order to meet the demand for long-term loans on easier terms of repayment and on a higher ratio in relation to farm value than that available from the Canadian Farm Loan Board and to facilitate refinancing indebtedness, the Province of Quebec has established its own farm credit scheme by the creation, in the autumn of 1936, of the Quebec Farm Credit Bureau, which commenced operations in March, 1937.

‡ Revised by W. A. Reeve, Secretary, Canadian Farm Loan Board, Ottawa.

The average amount lent annually during the first ten years of operations was \$3,860,000. The volume of loans approved dropped from \$4,348,950 in 1940 to \$1,215,450 in 1943 but, since then, has increased steadily to \$3,419,150 in 1947. The trend in recent years is toward decreased borrowing to pay debts and increased borrowing to purchase land and farming equipment.

1.—Applications for Farm Loans Received, Loans Approved and Loans Disbursed, Years Ended Mar. 31, 1940-47

NOTE.—Figures for 1930-39 are given at p. 186 of the 1940 Year Book.

Farm Improvement Loans Act.*—The Farm Improvement Loans Act, 1944 (c. 41, Statutes of 1944), is designed to provide short-term and intermediate-term credit to farmers. Under its provisions, the Federal Government authorizes the chartered banks of Canada to make loans over a three-year period and up to \$250,000,000 under a 10 p.c. Government guarantee against loss. The Act was extended another three years by an amendment passed at the 1948 session of Parliament. The maximum of an individual loan is \$3,000, the interest rate is 5 p.c. simple interest, and the repayment periods are from one to ten years, depending upon the amount borrowed and the purpose for which the loan is obtained. Loans under the Act are restricted to farmers.

* Prepared by D. M. McRae, Supervisor, Farm Improvement Loans, Department of Finance, Ottawa.

There are two broad aims behind this legislation, the first of which is the improvement and development of farms. Loans are made to enable a farmer to equip his farm with modern, labour-saving equipment, more and better live stock, and to make such other improvements necessary to maximum farm production. The second is the improvement of living conditions on farms. These loans enable the farmer to provide his home with electrification, refrigeration, heating systems, water systems, and all those things that make for comfort and convenience in living and do much to eliminate the drudgery of the farm housewife.

There are seven classes of Farm Improvement Loans: (1) purchase of agricultural implements; (2) purchase of live stock; (3) purchase of agricultural equipment or installation of a farm electrical system; (4) alteration or improvement of a farm electrical system; (5) fencing or drainage; (6) construction, repair or alteration of, or addition to, farm buildings; (7) general improvement or development of the farm.

Up to Dec. 31, 1947 (which period covers the first thirty-four months of operation of this Act), 39,387 loans were made for a total of \$31,423,129.23. Particulars of loans by provinces are:—

<u>Province</u>	<u>No.</u>	<u>Amount</u>
		\$ cts.
Alberta.....	14,600	11,176,435.47
Saskatchewan.....	12,908	10,438,919.84

New Brunswick.....	126	107,370.71
Prince Edward Island.....	42	23,671.50

Research and Experimentation

In its efforts to aid the farmer in the solution of his problems, the Department of Agriculture conducts, on a broad scale, scientific research and experimentation on the control of pests and diseases, the nutritional requirements of plants and animals, the micro-biology of soils and foods, the breeding and testing of new varieties of plants and animals, investigations of crop production and cultural methods and many other matters. The two main divisions of the Department that carry on such work are Science Service and Experimental Farms System.

Science Service.—The work of Science Service is directed toward the solution of practical problems of agriculture through the application of scientific investigation. The work is carried on in co-operation with other agencies within the Department, not only at the central laboratories at Ottawa, but at branch laboratories all across the country.

Many studies are being carried on in the field of animal pathology. Among the more important are a comprehensive investigation of the antigenicity of tuberculin and a fundamental investigation of the reactivity of fowl to various invading agents, with a view to perfecting diagnostic procedures. Bang's disease and mastitis of cattle are being investigated, while with poultry major attention is focused on pullorum disease and coccidiosis.

The research work of the Division of Bacteriology and Dairy Research is devoted to problems of milk production and the manufacture of dairy products, food processing and preservation, soil fertility, and to other varied problems of agricultural production bearing on the science of microbiology.

Dairy research includes studies in improved methods for clean milk production and the evaluation of milk quality. Projects in cheese investigation deal with better control of the manufacturing process, and the cause and remedy of defects of flavour and texture in Cheddar cheese. Methods for improving the keeping quality of butter are also under study.

Studies in food microbiology are directed towards improvement in quality of Canadian fruit and vegetables preserved by different methods, with special attention to frozen-pack products. Improvement in production and in control methods for dried-egg products are under study.

Fundamental studies of soil micro-organisms are being conducted as a basis for application to practical problems of soil fertility and crop health. Research is also conducted on the inoculation of seed and soil by nitrogen-fixing bacteria; microbiological methods for evaluating soil fertility; and the relation of soil micro-organisms to soil-borne plant diseases. Other research projects deal with such diverse problems as fowlbrood diseases of bees, the development of microbiological methods for vitamin assay, and the detection of new anti-biotics which may have important applications in agriculture.

Weeds constitute one of the more important problems with which the farmer must contend. In the botanical laboratories, research is in progress on the occurrence and distribution of weeds throughout Canada. Life histories of weeds are studied together with methods of control of certain species. Physiological studies on the effects of herbicides are being carried on.

The Dominion Arboretum and Botanic Garden grows an extensive collection of trees and shrubs that is of much interest to horticulturists, botanists and the general public. A plant identification service is provided and research conducted on the classification and distribution of the native and introduced plants of Canada.

In an effort to reduce the losses from seed-borne diseases of crop plants, seed-testing techniques are being investigated with a view to determining the presence of pathogenic organisms in or on the seed. Various commercial disinfectants and seed-treating machines are under test to determine their value in the control of seed-borne diseases.

Diseases of cereal and forage crops are under constant study with the object of evolving effective measures and developing resistant varieties which will produce satisfactory crops in the presence of disease organisms. Similar investigations are conducted with horticultural crops with major attention directed to crop protection and disease control rather than development of resistance. In the case of potatoes, however, breeding for disease resistance is being carried out in co-operation with the Experimental Farms Service.

In the chemical laboratories of Science Service, research projects are in progress on animal nutrition, food and plant chemistry, soils, fertilizers, and vitamin and physiological chemistry. A study of factors affecting the digestibility of feeds and an evaluation of feeding stuffs on the basis of digestibility, together with research on the biological value of proteins and non-protein nitrogen in which stable isotopic tracers are employed, will provide useful information for the scientific feeding of different classes of live stock. Vitamin studies include the mode of action of vitamins A and D, the utilization of precursors and the effect of other dietary factors on vitamin action, together with a critical evaluation of both chemical and biological methods of vitamin assay. Studies in progress demonstrate the usefulness and

the dangers of hormonal stimulation and of endocrine depressors for dairy cattle and poultry. Of interest also to the stockman is the chemical and biological diagnosis of pregnancy and the tattooing of live stock for identification purposes.

Research in soil chemistry includes a study of the colloid fractions of soils in relation to soil types, soil fertility and phosphate fixation; a study of the composition of soil organic matter and its maintenance in cultivated soils; an investigation of the mineralogical composition of Canadian soils; the adaptation of chemical methods for the determination of fertilizer requirements of soils, and studies of the minor element content of soils in relation to physiological disorders of plants and animals. Soil fertility investigations are conducted in the field and greenhouse in connection with fertilizer trials on soil types, the effect of soil amendments on soil reaction and crop growth, the effect of crop rotations on the nitrogen and organic matter content of prairie soils, the production of canning and orchard crops, and the reclamation of saline soils resulting from flooding by sea water.

Investigations under way in the field of entomology embrace studies of insects affecting man and animals, forest, field, garden and orchard crops, and materials in transit or storage. Specific projects relate to the studies of harmful and beneficial insects, appraisal of their damage, and methods for their control. The methods of control under study include management practices, cultural measures, chemicals, and the production and dissemination of parasites and diseases that attack noxious insects.

Studies on insects attacking man and animals include a wide range of household pests, cattle warbles, ticks, and lice; the preparation and testing of repellents for protection from biting flies; and control of mosquitoes and houseflies over extensive areas. Considerable attention is being given to the newer insecticides and practical methods for their application.

Forest-insect control activities embrace the nation-wide forest-insect survey, begun in 1936, and intensified in recent years in an effort to devise a reliable means of forecasting impending outbreaks. Particular attention is given to such widespread destructive pests as the spruce budworm and sawflies attacking conifers, the hemlock looper and bark beetles, the bronze birch borer and the vectors of Dutch elm disease. Control investigations centre around long-term forest management projects, the use of parasites and diseases, and the exploration of the possibilities of chemical control.

Field-crop and garden insect investigations include studies on grasshoppers, the wheat-stem sawfly, wireworms, cutworms, white grubs, the European corn borer, root maggots, potato aphids, and nematodes. The abundance and distribution of these pests are measured annually by extensive field surveys which provide a basis for planning control campaigns. Insecticides are widely employed in these investigations. Where possible, however, modification of cultural practices are utilized, especially in the control of insects injurious to field crops.

Of the orchard pests, codling moth, European red mite, eye-spotted budmoth, apple maggot, oriental fruit moth, oyster-shell scale and pear psylla are among the subjects of major study. Emphasis is placed on the use of recently developed insecticides, including their combination with fungicides, and on the effect of spray programs upon the whole biotic complex of the orchard. Insect control by parasites and diseases and by orchard management is receiving increased attention.

Research on stored-products insects embraces such pests as the rust-red grain beetle, the Indian meal moth, mites, and spider beetles. Practical controls have been developed utilizing fumigants, abrasives, mechanical methods, proper storage construction, and plant management.

Special consideration is given at the Dominion Parasite Laboratory, Belleville, Ont., to the importation and production of insect parasites of injurious species for distribution in forests, fields, gardens, orchards, and greenhouses. At present, parasites are employed in Canada against thirty important insect pests.

A National Collection of insects is maintained. The specialists engaged in this enterprise provide an identification service in addition to performing formal studies in taxonomy and biology of insects.

Activities designed to prevent the introduction into Canada of foreign insects and plant diseases are centred in the Division of Plant Protection. In addition, this Division is responsible for the examination of plants and plant products being exported to countries requiring such material be free of plant pests and diseases. The supervision of the production of seed potatoes throughout Canada in accordance with the regulations in effect; the supervision of surveys and control of newly introduced destructive plant pests and diseases; and the supervision of fumigation experiments to destroy insect life in plants and plant products at varying temperatures, with various lethal fumigants are all functions of the Division. The effects of fumigants on suitability of products for human consumption or for seed are also under study.

The Dominion Experimental Farms

Organization.—The Dominion Experimental Farms were established by an act of Parliament passed in 1886. This Act described the main lines of investigational work to be undertaken. These included live-stock breeding, nutrition, dairying, the development of cereals, grasses, legumes, forage plants, fruits and vegetables; the study of seeds, fertilizers, plant diseases and insect pests; and "any other experiments and researches bearing upon the agricultural industry of Canada which are approved by the Minister". In later years some of these activities have been transferred to other branches of the Department.

In order to accomplish these important objectives, an organization has been developed consisting of a Central Experimental Farm at Ottawa, branch stations located in the more important agricultural regions of Canada and sub-stations placed in localities where special problems are to be studied. These branch stations are located in every province and extend from the most highly developed types of agriculture to pioneer regions, including Yukon and the Northwest Territories. In 1915, a system of Illustration Stations was organized to provide a connecting link between the Experimental Farms and farmers located in outlying districts. These Stations are on private farms and are operated on the basis of a co-operative agreement with the owner. They are really sub-stations conducting a wide field of experimental work to help solve some of the many agricultural problems which arise throughout Canada. At the present time there are 211 of these Illustration Stations.

The Central Experimental Farm at Ottawa is the headquarters of the organization. The Director and the staff of ten Divisions engaged in special fields of agricultural research are located at Ottawa. These Divisions include: Animal Husbandry, Bees, Cereals, Economic Fibre Production, Field Husbandry, Forage

Plants, Horticulture, Illustration Stations, Poultry and Tobacco. They co-operate with the Branch Stations throughout Canada in organizing a co-ordinated plan of agricultural experimental work.

Regional Stations.—It might be asked why Branch Stations are required throughout Canada. The answer is because Canada is such a large country geographically and contains so many widely different soil and climatic conditions that experimental work must be arranged to meet these varied requirements. Some soils are very fertile; others are quite unproductive; some are heavy clay; others light sand, with numerous intermediate textures. Some soils are acid and others alkali.

Temperatures in different parts of Canada vary widely. The mean January temperature of the Dominion Experimental Station at Saanichton, B.C., is 37.9°F. above zero but at Fort Vermilion in northern Alberta it is 11.1°F. below zero. The mean July temperature at Harrow in Southwestern Ontario is 72.9°F., but at Smithers in northern British Columbia it is only 57.0°F. Precipitation, also, is very different. At Agassiz, B.C., it is 62.3 inches a year but at Summerland, B.C., it is a mere 10.5 inches and irrigation is required for successful agriculture. Obviously, these different soil and climatic conditions exert a profound effect upon the growth of various crops.

Besides these conditions, there are many different types of farming in Canada including wheat, fluid milk, butter, cheese, beef cattle, sheep, hogs, poultry, fur animals, tree fruit, small fruit, vegetables, tobacco, fibre crops, and many others. Every farmer engaged in each of these special types of farming requires information related specifically to his work. With 732,832 farms in Canada, according to the 1941 Census, it is obvious that agricultural experimental work must be undertaken on such a comprehensive basis that reliable information may be available to as large a proportion of farmers as possible. This can be accomplished only on a regional basis but with a central headquarters to organize the work in various parts of the country so as to avoid overlapping and to promote efficiency.

Main Accomplishments in Plant Breeding.—Possibly it is in the field of plant breeding that the accomplishments of the Dominion Experimental Farms are the most outstanding, or at least the best known. New varieties of various crops developed by the Experimental Farms are tangible examples of improvements which bring greater returns to the individual farmer and to the country. Over a period of 62 years, since the inception of the Dominion Experimental Farms, many hundreds of varieties of various species of crops have been developed. Great care is taken to ensure that any new variety possesses improved yield, quality and other factors before being released to the public.

Since the origination of Marquis wheat, a variety which for many years was grown almost to the exclusion of other varieties in the spring wheat areas of Canada and the United States, several improved rust-resistant varieties have been developed by the Cereal Division. Renown, Regent and the recently developed Redman are important achievements. Rescue, a variety recently developed to combat the western wheat stem sawfly, has proved very valuable in regions where this insect is prevalent. In eastern Ontario the winter wheat variety, Rideau, has proved more winter hardy and productive than existing material.

Improved varieties of oats, barley, rye, flax, peas and beans have been developed, applicable to the varied conditions in different parts of Canada.

While the acreage of corn is not extensive in Canada, the improved results from new hybrid corn varieties give considerable promise of extending the acreage of this crop. Both for grain and silage, hybrid varieties have given much better results. As the production of corn for grain has now become as completely mechanized as the production of wheat, the improved hybrid varieties offer an excellent opportunity of securing a new cash crop in many regions which can be handled with a minimum of labour. Several varieties of soybeans have been originated by the Forage Plants Division which enable this crop to be grown in regions where formerly the varieties were too late to mature. Improved varieties of grain and fodder millet have been created.

Investigational work on plant breeding has been undertaken for a number of years on the Dominion Experimental Farms. Hybrids have been created between wheat and certain species of grass. These have been back-crossed on wheat or grass in an effort to secure the qualities desired. Great difficulties were at first encountered with sterility but this has been gradually overcome. In Russia, it is said that the objective has been to develop a perennial wheat which might be sufficiently winter hardy to survive in the more southerly parts of that country. In Canada, while the plant breeding program has been directed towards the two objectives of grain and forage, it has been more successful in developing a large-seeded, drought resistant, fertile, perennial grass which may prove useful in some of the drier regions.

Plant breeding with tree fruits is subject to the great handicap that many years must elapse before it is possible to estimate whether or not any new variety is successful. The tree must bear fruit before its quality can be determined. Then, the hardiness of the tree itself cannot be learned until a severe winter has been experienced. The many years of experimental work on the Dominion Experimental Farms have proved particularly valuable in providing an opportunity to develop several successful varieties of apples. In eastern Ontario and Quebec, four of the six commercial varieties recommended for this region were originated at Ottawa. These varieties include Melba, Lobo, Atlas and Joyce. In addition, several new varieties show considerable promise. In the northern parts of Canada, tree fruit has been restricted by the severity of the winters. Considerable progress has been made through hybridization in the development of certain fruits suitable for home gardens.

Hardy root-stocks are a very important phase in the improvement of tree fruit applicable for Canadian conditions. The customary plan is to use roots from the seed of French crabs and to propagate the desired varieties onto these roots. However, these roots may or may not be sufficiently hardy and they are certain to be very variable on account of their seed origin. In an effort to develop improved root-stocks, the Horticultural Division has grown a large number of French crabs and other species and has kept the ground free of snow for several winters. This severe treatment resulted in the death of the great majority of the trees and the survival of only a very few. These survivors were carefully studied and used to grow new clonal root-stocks vegetatively rather than by seed. This has resulted in securing a supply of uniform and extremely hardy root-stocks (especially one known as Robusta No. 5) which are known to be vigorous and compatible with the varieties to be grafted or budded to them.

The tobacco industry in Canada has been almost completely transformed during the past thirty years. In the early days production was restricted in Ontario to burley, and in Quebec to pipe and cigar leaf tobacco. However, as consumer

taste shifted largely to cigarette consumption, production changed so much that by 1947, 86 p.c. of the crop was of the flue-cured cigarette type. In 1920, Canada imported approximately 20,000,000 lb. of tobacco, in 1945 imports were only about 1,333,000 lb., confined largely to cigar leaf. Exports in 1939 amounted to 32,000,000 lb. The content of Canadian tobacco in all cigarettes consumed in Canada has increased from 30 p.c. in 1927 to 99.5 p.c. in 1947.

Plant breeding, conducted through the Tobacco Division, has greatly aided the tobacco industry. It is estimated that 80 p.c. of the burley tobacco grown in Ontario is produced from three varieties known as Harrow Velvet, Haronova and Harmony, developed on the Dominion Experimental Station at Harrow, Ont. Some 50 p.c. of the flue-cured tobacco crop is grown from varieties selected and improved by the Dominion Experimental Farms. A new variety, known as Delcrest, of outstanding promise with respect to root-rot resistance as well as quality, yield and earliness, is being released in 1948 for general distribution to the growers. Practically all the cigar leaf grown in Canada is produced from varieties developed by the Dominion Experimental Farms.

Other Phases of Experimental Work.—The foregoing material has been confined exclusively to some of the accomplishments in the field of plant breeding. The Dominion Experimental Farms are engaged, however, in a wide program of agricultural experimental work. This includes investigations on over 1,600 experimental projects located in various parts of Canada. Investigations are conducted on the breeding, feeding and management of various classes of live stock and poultry; fur-bearing animals; the production, harvesting and storing of various crops; the production of honey, and of economic fibre; the tilth, fertility and conservation of the soil; soil survey, conducted in co-operation with the nine provinces of Canada; irrigation and agricultural engineering.

The results of this investigational work are given to the public by means of bulletins, reports, pamphlets, articles in the press, correspondence, meetings, and through visits to the various Dominion Experimental Farms and Illustration Stations. The improved live stock and poultry on these Stations serve as a source where local farmers may secure valuable breeding stock. New varieties of grain, forage, horticultural and tobacco crops are released as soon as their value is definitely known.

Subsection 3.—Provincial Departments of Agriculture

Each of the nine provinces, under Sect. 95 of the British North America Act, has a Department of Agriculture, which directs its general agricultural policies, administers the provincial legislation affecting agriculture, and provides extensive services to assist the rural people in its respective area. The work of these Departments is outlined at pp. 213-218 of the 1946 Year Book.

Subsection 4.—Provincial Agricultural Colleges and Schools

A treatment of this subject appears at pp. 203-213 of the 1943-44 Year Book.

Section 3.—Statistics of Agriculture*

Crop-Reporting Service.—Through the voluntary crop-reporting service of the Federal Government, accurate, timely and independent reports on crop conditions throughout the Dominion are published.

Census Statistics.—In addition to the statistics collected annually, which are the subject of this Section, valuable information is published following each Decennial Census of the Dominion and each Quinquennial Census of the Prairie Provinces. The more important data at present available from the 1941 Census, are given at pp. 250-254 of the 1946 Year Book; see pp. 390-396 for recent data on the Quinquennial Census.

Subsection 1.—Farm Cash Income

A preliminary estimate indicates that, during 1947, Canadian farmers' cash returns from the sale of farm products established an all-time recorded high of \$1,990·6 million. When compared with the revised estimate for 1946 of \$1,752·7 million, the 1947 figure represents a gain of \$237·9 million or 13·6 p.c. As against the previously recorded high of \$1,829·0 million in 1944, the 1947 cash income exhibits an increase of \$161·6 million, or 8·8 p.c. Including supplementary payments, cash receipts in 1947 amounted to \$2,002·2 million as compared with \$1,769·6 million in 1946.

An increase of \$128·6 million from the sale of grain, seed and hay in 1947 over 1946 is largely attributable to generally higher prices and substantial payments made on wheat participation certificates as well as adjustment payments made on wheat and barley deliveries. Generally, larger marketings and higher prices for hogs served to offset the decline in the marketings of other classes of live stock to give total receipts from the sale of live stock of \$590·1 million in 1947 as against \$574·6 million a year ago. Cash income from the sale of farm products is higher in 1947 in all provinces except Nova Scotia. The decline in Nova Scotia is accounted for, in large part, by lower income from potatoes and fruits.

The estimates contained herein are based on reports of marketings and prices received by farmers for principal farm products and are subject to revision as more complete data become available. The estimates include the amounts paid on account of wheat participation certificates, the oats and barley equalization payments and those Federal and Provincial Government payments which farmers receive as subsidies to prices. Payments made under the Wheat Acreage Reduction Act, the Prairie Farm Assistance Act and the Prairie Farm Income Act are not included with cash income from the sale of farm products but are included in the totals in the year in which payment is made under the heading "Supplementary Payments".

* Revised in the Agricultural Branch, Dominion Bureau of Statistics. This Branch collects and publishes both primary and secondary statistics of agriculture, including statistics of the production and distribution of agricultural commodities. The primary statistics relate mainly to the reporting of crop conditions, crop and live-stock estimates, values of farm lands, wages of farm labour and monthly and annual prices received by farmers for their products. The secondary statistics relate to the marketing of grain and live stock, dairying, milling, and sugar industries and cold-storage holdings.

Subsection 2.—Value of Agricultural Production and of Farm Capital

Publication of the series formerly known as "Gross and Net Values of Agricultural Production" has been discontinued. These series contained duplications and, as a result, were not comparable with value of production estimates for other industries. Work is now under way on new series which will replace those previously published.

Value of Farm Capital.—The items included in the term "farm capital" as used in Table 5 are: lands and buildings; implements and machinery, including motor-trucks and automobiles; and live stock, including poultry and animals on fur farms. The value of lands and buildings for intercensal years is based on the value of occupied farm lands reported annually by crop correspondents; annual values of farm implements and machinery are estimated on the basis of sales reported each year.

¹ Revised since the publication of the 1947 Year Book.

² Includes poultry and fur farms.

Average Values of Farm Lands.—The estimated average value of occupied farm land in Canada for 1947 is reported at \$35 per acre. This represents an increase of 9 p.c. over the average value indicated in 1946 and an increase of 40 p.c. over the 1939 average. The total average is determined by weighting the provincial averages by the area of occupied farm land in each province according to the latest census figures available. The upward trend in farm land values from pre-war levels reflects, at least in part, the relative changes which have occurred in the price levels of farm products and of the things which farmers buy. The Bureau's index of farm prices of agricultural products for 1947 was 95.5 p.c. above the 1935-39 level, while for the same year the index of prices of commodities and services used by farmers had advanced 57.4 p.c. from the 1935-39 base-period level.

Subsection 3.—Acreages, Yields and Values of Field Crops

In setting acreage targets for grains, forage crops and feed the objective, in 1947, was to determine an acreage distribution which would, under average conditions of production, provide adequate quantities of wheat for export and domestic use and at the same time allow for sufficient feed grain to carry the recommended live-stock program. An increase in linseed-flax production was also deemed desirable in order to help alleviate world shortages of fats and oils.

In order to provide the quantities of feed grains required it was considered necessary to recommend a decrease in wheat acreage. The recommendation for wheat acreage for all Canada was set at 24,000,000 acres, some 600,000 acres above the 1946 recommended acreage objective but about 500,000 acres below the actual 1946 seeded acreage. Coarse grain targets were set as follows: oats 14,300,000 acres; barley 8,000,000 acres. These represent substantial increases over the actual 1946 acreages. The target for rye was set at 487,100 acres which was the acreage seeded in 1945. In 1946, 715,000 acres were seeded to this crop.

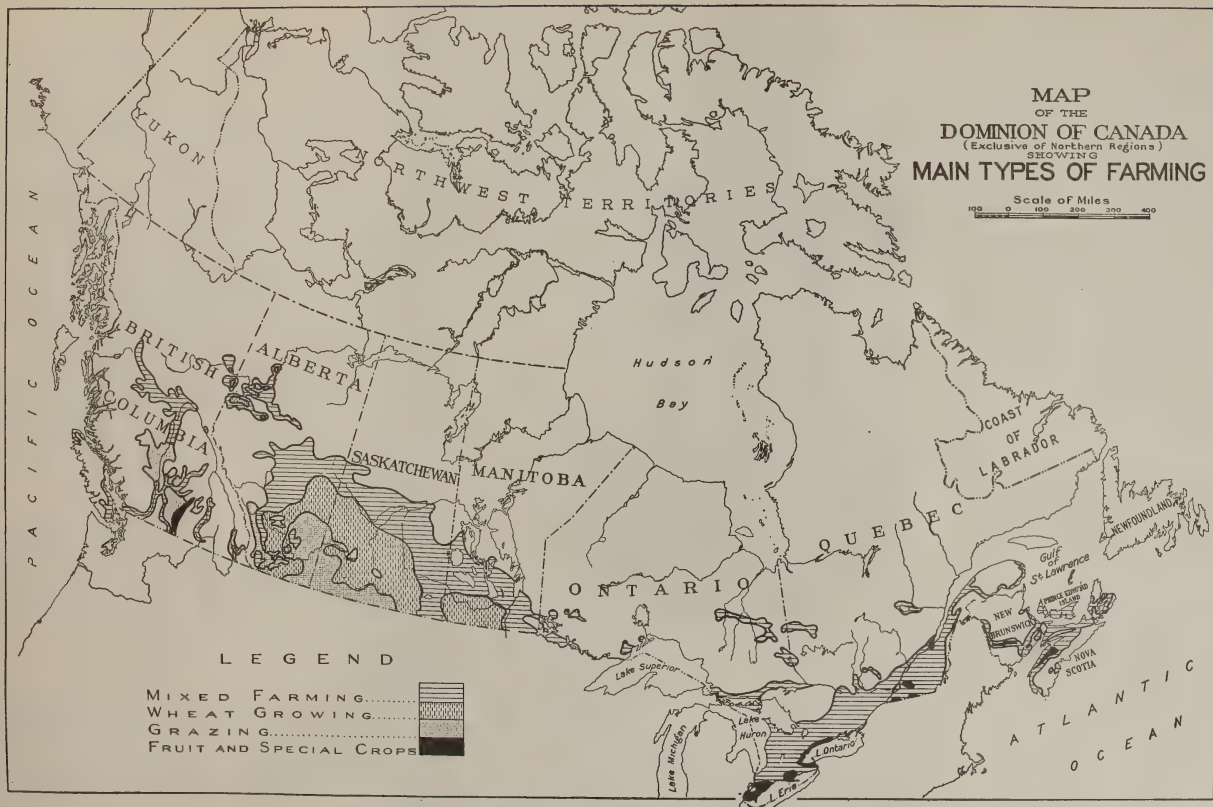

When the official acreage estimates became available in mid-summer, it was found that the wheat acreage had exceeded the target by slightly more than 250,000 acres. Oats fell short of the target with only 11,048,500 acres seeded. While barley acreage increased by more than 1,000,000 acres, it was still short of the target by over 500,000 acres. The high prices prevailing for rye encouraged growers to seed more of this grain with the result that the acreage in this crop exceeded 1,000,000 acres, more than double the amount seeded in 1945. Coarse grain acreages would have been much nearer the target had it not been for highly unsatisfactory seeding conditions experienced in the eastern provinces in the spring of 1947. In the west, a mid-summer heat wave across the Prairies followed by unseasonable harvesting and threshing weather in the northern sections of Saskatchewan and Alberta caused yields to fall below average. Total wheat production amounted to 340,758,000 bu. as compared with 413,725,000 bu. in 1946. Production of oats was down from 371,069,000 bu. in 1946 to 278,670,000 bu. in 1947. Increased acreage in barley was more than offset by reduced yields, production for 1947 amounting to 141,372,000 bu. as compared with 148,887,000 bu. in the previous

year. Due to sharply increased acreages the returns of both rye and flaxseed were far in excess of those of 1946, the 1947 rye crop amounting to 13,217,000 bu. (8,811,000 bu. in 1946) while the flax crop reached a total of 12,240,800 bu. (6,402,700 bu. in 1946).

The gross farm value of all major field crops produced in 1947 on Canadian farms amounted to \$1,315,000,000. This is the fifth highest gross value recorded since this series was initiated in 1908 and compares with a total value of \$1,248,000,000 in 1946.

Acreages and values of field crops in 1947 showed slight increases of only 2 p.c. and 5 p.c., respectively, over those of the previous year.

The values per unit assigned to each 1947 crop in Table 8 of this subsection represent average prices from Aug. 1, 1947 to Jan. 31, 1948. No attempt has been made to estimate prices nor the effect of certain payments on these prices accruing to the farmer at the end of the crop year. The average prices have been determined after consultation with the Provincial Departments of Agriculture and careful consideration has been given to such factors as quality and grade.

Total values of crops in this table do not represent cash income received from sales but are gross values.

7.—Acreages and Values of Field Crops, by Provinces, 1941-47

NOTE.—Some of the figures in this table, particularly the values, have been revised since the publication of the 1947 Year Book.

8.—Acreages, Yields and Values of Principal Field Crops Grown in Canada

NOTE.—Comparative figures for the Dominion as a whole for earlier years are given in the corresponding table of previous editions of the Year Book. For a record of certain figures of acreage, production and value, see Statistical Summary of the Progress of Canada at the beginning of this volume. For the majority of crops, the long-time average covers the years 1908-40. Figures for 1947 are preliminary and therefore subject to revision.

SUMMARY, SHOWING YIELDS AND PRICES, 1945-47, WITH LONG-TIME AVERAGES

Crop and Year	Area	Yield per Acre	Pro-duction	Average Price	Total Value	Crop and Year	Area	Yield per Acre	Pro-duction	Average Price	Total Value
	'000 acres	bu.	'000 bu.	\$ per bu.	\$'000		'000 acres	bu.	'000 bu.	\$ per bu.	\$'000

¹ Revised since the publication of the 1947 Year Book.

² Subject to revision.

Stocks of Grain in Canada.—Table 10 shows the stocks of Canadian grain on hand on July 31, for the years 1937-47, in both Canada and the United States as well as the amounts held on farms at that date. Farm stocks are given for Canada and the Prairie Provinces separately, while an additional column indicates the amounts held in country elevators in the Prairie Provinces.

10.—Carryover of Canadian Grain as at July 31, 1937-47

Subsection 4.—Live Stock

The growth of the live-stock industry in Canada from decade to decade is indicated in summary form in Table 11.

11.—Live Stock in Canada, Censuses of 1871-1941

Item	1871	1881	1891	1901	1911	1921	1931	1941

¹ Cows in milk or in calf.

² Cows and heifers, two years old or over, kept mainly for milk purposes.

Live stock on farms as obtained from the census data cannot be separated from the total numbers except for the past three census years. Table 12 gives the numbers of live stock on farms for those years.

12.—Live Stock on Farms, Censuses of 1921, 1931 and 1941

Item	1921	1931	1941

Swine.....	3,324,291	4,699,831	6,081,389

¹ Cows in milk or in calf.

² Cows and heifers, two years old or over, kept mainly for milk purposes.

However, annual estimates, based on census data, are compiled for numbers of animals on farms. The indexes in Table 13 are the estimates of live stock for the respective years expressed as percentages of the numbers on farms during the period 1935 to 1939. Table 14 gives the absolute figures by provinces for 1943-47 and Table 15 the average values per head of farm live stock in the same years.

13.—Index Numbers of Animals on Farms, 1937-40, 1942-47

(Average 1935-39=100)

NOTE.—Comparable figures for 1906-36 are given at pp. 211-212 of the 1945 Year Book.

¹ Revised since the publication of the 1947 Year Book.

Under the Meat and Canned Goods Act, establishments such as abattoirs and meat-packing plants that prepare meat products for export are subject to inspection. Local wholesale butchering and such slaughtering as are carried out by retail butchers and by farmers for their own use are not included in Table 16. Actually, the growth of the slaughtering and meat-packing industry has been accompanied by a concentration of the major part of the production into a comparatively small number of large establishments to facilitate greater efficiency and utilization of products. These figures, therefore, are fairly inclusive. The industry is dealt with in its proper relation to all other manufacturing enterprises in Chapter XVI. It normally ranks among the three or four largest manufacturing industries in Canada, in gross values of production but, as the chart at p. 564 indicates, it owes its importance to the value of raw products obtained from the farmer and rancher rather than to the value added by the manufacturing process.

Wool.—Total wool production in Canada in 1947 amounted to 14,090,000 lb. as compared with a revised estimate of 16,747,000 lb. for 1946. Adjustments in the estimates of numbers of sheep were necessary when information from the 1946 Census of the Prairie Provinces became available; this has necessitated a revision of the estimate of the wool clip for that year. The very significant decline in wool production in 1947 reflected the decrease in sheep numbers. Shorn wool production decreased in every province. With fewer sheep available for slaughter, production of pulled wool also decreased by 1,400,000 lb.

Domestic disappearance of wool in 1947 was 88,882,000 lb. as compared with 110,380,000 lb. in 1946. As data on stocks are not available, the estimates of domestic disappearance are subject to error to the extent that changes in stocks actually took place. Wool imports during 1947 decreased by about 20,000,000 lb. from the previous year.

The farm value of shorn wool and farm cash income from the sales of wool rose steadily from 1939 to 1944. Since 1945, however, the rapid decline in the number of sheep has resulted in less income from wool despite a gradual rise in farm prices. The average farm price of wool for Canada changed only fractionally during the last year from 28 cents per lb. in 1946 to 28.2 cents per lb. in 1947.

17.—Estimated Production, Exports, Imports and Apparent Consumption of Wool, 1937-40, 1942-47

NOTE.—All estimates are on a 'greasy' basis. Comparable statistics of production for the years 1920-29 are given at p. 219 of the 1939 Year Book and for 1930-36 at p. 214 of the 1945 edition.

¹ Revised since the publication of the 1947 Year Book.

² Subject to revision.

Subsection 5.—Poultry and Eggs

There was an increase of 9 p.c. in the total number of poultry on farms at June 1, 1947, as compared with June 1, 1946. The total farm value of poultry was 16.6 p.c. greater than in 1946, the value per bird having increased in each class. While the numbers of geese and ducks declined 9 and 7 p.c. respectively there was an increase of 9 p.c. in the number of hens and chickens and a 20 p.c. increase in turkeys.

Egg production during 1947 was 15.5 p.c. above that of 1946 with a total value 18.8 p.c. higher. Production of poultry meat increased by 13.7 p.c. as compared with the previous year, with a 10.7 p.c. increase in total value.

Subsection 6.—Dairying

The dairy industry of Canada made its greatest development after the close of the First World War when the demand for food products created new outlets for dairy products. From 1920 to 1925 the numbers of milch cows kept, advanced from 2,986,000 to 3,273,000 and the production of milk moved up from 10,976,000,000 lb. to 13,421,000,000 lb. The peak in milk production was reached in 1926 with 13,475,614 lb. but the decline in the dairy-cow population which was shown in the period 1926 to 1930 had already set in.

The further development of dairying enterprises which commenced at the beginning of the Second World War reached a peak in 1945. Milk production on farms was stimulated by producer subsidies during the entire war period, while the payment of consumer subsidies tended to increase the sales of fluid milk for direct consumption. During the six-year period, 1939 to 1945, milk production increased approximately 1,800,000,000 lb. and the industry, as a whole, made an immense contribution to the food supplies of both Canada and the United Kingdom. Higher prices paid for grain and live stock and the cumulative effects of the labour shortage, all played a part in halting the upward swing in dairying production in Western Canada. On the other hand, dairying continued to expand in Eastern Canada, so that no decline was shown in the total output for Canada until 1946.

A notable feature of the dairy situation is the shift in production which has given Western Canada a larger share of the expansion in dairying enterprises. In 1920, Ontario and Quebec contributed approximately 67 p.c. of the total milk

production of the Dominion; the Prairie Provinces produced 22 p.c., while the Maritimes and British Columbia shared to the extent of 9 p.c. and 2 p.c., respectively. In 1925 the Prairie Provinces contributed 26 p.c. and British Columbia 3 p.c., whereas the production of Ontario and Quebec fell to 63 p.c. and the Maritimes to 8 p.c. A further shift in favour of the Prairie Provinces was recorded in 1932, and by 1945 (the peak year), Ontario and Quebec were supplying only 62 p.c. of the milk production while the Prairie Provinces produced 28 p.c., the remaining 10 p.c. being divided between the Maritimes and British Columbia in the ratio of approximately 6 to 4.

21.—Production and Utilization of Milk in Canada, 1942-47, and by Provinces, 1946 and 1947

NOTE.—Figures for the years 1921-41 are given at p. 6 of the report "Dairying Statistics of Canada, 1947"; for the years 1939-41 at p. 237 of the 1946 Year Book.

¹ Includes malted milk, cream powder, 1942-47, and condensed coffee, in 1942, items which do not appear separately in this table.

² Includes milk by-products items not separately listed, namely, condensed buttermilk, powdered buttermilk, sugar of milk, and casein, 1942-47, and sub-standard products, 1944-47.

³ Ice cream in terms of milk is included in the total for all products; on a per capita basis the 1947 disappearance amounted to 1.87 gal. of the product and 26.70 lb. expressed as milk.

It will be observed from the accompanying chart that the proportion of milk used in factories has decreased in recent years. On the other hand, with the growth of urban centres the proportion used for fluid sales moved to a higher level. Between 1920 and 1925 the percentage of the total milk supply used for the production of factory dairy products increased from 42 to 46 p.c., while the quantities employed for manufacture on farms fell from 22 p.c. to less than 19 p.c. By 1935, factory production took 48 p.c. and fluid sales, which had taken only 14 p.c. in 1920, stepped up to 19 p.c. These increases were reflected in farm manufacturing, the milk required for this purpose having fallen to less than 16 p.c. There was very little change until the outbreak of the War in 1939. By 1945, increased demand for fluid milk boosted sales to 23 p.c., and advanced factory requirements to 56 p.c. All sections of the country have been using increased quantities of fluid milk, particularly during the war years, but the proportion of fluid sales to the total available has been most evident in the Prairie Provinces and in Ontario and Quebec.

Butter Production.—The most pronounced increases in creamery butter production took place between 1940 and 1941 and between 1942 and 1943. In the latter year it reached the high point of 312,000,000 lb., falling in the next twelve-month period to 299,000,000 lb., and in 1946 to 271,000,000 lb. With the removal of rationing and price regulations in 1947 the output moved to higher levels with a total production of 291,000,000 lb.

Due to price advantages offered to creamery patrons already referred to, a sharp recession in dairy butter production occurred during the war years, and the 1945 production was the lowest on record, amounting to approximately 53,000,000 lb. In 1946, it advanced to 54,000,000 lb. and in 1947 a total production of 56,000,000 lb. was recorded. Creamery and dairy butter combined, reached the high point in 1941. In 1945, it had fallen to 347,000,000 lb. and in 1946 to 326,000,000 lb. Increases occurred in both the creamery and dairy make in 1947, the total output for that year being 347,000,000 lb.

24.—Production of Butter and Cheese in Canada, 1942-47, and by Provinces, 1946 and 1947

NOTE.—Figures for the years 1921-41 are given at p. 6 of the report "Dairying Statistics of Canada 1946"; for the years 1939-41 at p. 237 of the 1946 Year Book.

¹ Includes cheddar, and other cheese made from whole milk. The latter, which amounted to 2,785,000 lb. in 1946 and 3,013,000 lb. in 1947, was produced in Quebec, Ontario, Manitoba, Saskatchewan and Alberta.

Cheese Production.—Competition with the butter industry placed cheese making in a subordinate position after 1925 but by 1937 the industry had recovered a little of its former strength, piling up a production of 131,000,000 lb. A recession developed during the next two years which may be attributed to the increased demand for creamery butter but a sharp upward movement took place in 1940 when cheese production increased approximately 20,000,000 lb. in one year. With a new price arrangement in 1942, the quantity manufactured was stepped up to

SALES INCOME FROM DAIRYING

1929, 1939, 1946 AND 1947

207,000,000 lb., the largest production since 1904. The 1947 output was 123,000,000 lb., a decrease of approximately 26,000,000 lb., as compared with that of the previous year.

The production of farm-made cheese is comparatively small compared with the factory product, seldom exceeding 1,000,000 lb. since the establishment of the factory system in the early 1880's. The 1947 production was 740,000 lb.

During recent years a wider range of cheese products has been manufactured in Canada; Roquefort and Cheshire types of cheese are now being produced in small quantities. Oka and Trappist cheese have been made in the Trappist monasteries for a number of years, and limited quantities of Limburger and lesser known varieties are also being produced to meet the needs of a special trade. Processed cheese, a secondary product of cheddar cheese representing about 18 p.c. of the poundage, is another industry which has developed considerably in the past few years. In 1947, 27,000,000 lb. was manufactured in comparison with 12,000,000 lb. ten years ago. Then, too, greater use is being made of by-products from cheese. The production of lactose is a comparatively new development in Canada; the amount imported is still considerably in excess of the domestic output. This product is made from milk-sugar crystals obtained from whey by a process of evaporation. Lactose is being used for many purposes but it has gained special importance as a media for the growth of the mould from which penicillin is obtained.

Concentrated Milk Products.—Data covering products which appear in Table 25 include approximately 259,785,000 lb. of concentrated whole-milk products and 77,463,000 lb. of concentrated milk by-products. The total production of all products combined in 1947 amounted to approximately 337,248,000 lb. as compared with an output of 300,799,000 lb. in the preceding year. Since 1940 there has been a greater demand for evaporated milk, condensed milk and whole-milk powder both for export and for domestic use. Hence greater quantities of these products are now being manufactured than was the case in the pre-war years.

25.—Production of Concentrated Milk Products, 1943-47

Note.—Figures for the years 1921-42 are given at p. 12 of the report "Dairying Statistics of Canada 1947".

¹ Includes lactose.

Ice Cream Production.—The output of ice cream production was 23,510,000 gal. in 1947 as compared with 15,829,000 in 1946. This increase was due to the removal of restrictions on the quantity manufactured for civilian use, which were in effect until 1947.

26.—Production of Ice Cream, by Provinces, 1943-47

NOTE.—Figures for the years 1921-42 are given at p. 14 of the report "Dairying Statistics of Canada, 1947".

Domestic Disappearance of Dairy Products.—Milk consumption statistics reveal the increasing popularity of this product as an article of food. Twenty-seven years ago the per capita consumption of milk (including cream expressed as milk) was estimated at 0.74 pint. Since that time the movement has been more or less in an upward direction. The 1947 figures show a per capita daily consumption of 0.97 pint, compared with 1.02 pints in 1946. The relationship between the amount used by non-producers and by milk suppliers was fairly constant, the former being approximately two-thirds of the total. Between provinces some variations were indicated, depending principally on the make-up of the population and, to a limited extent, on the quantities of milk shipped across provincial borders.

The domestic disappearance of total butter, which had been estimated at 33.69 lb. per capita in 1942, suffered a reduction of nearly $4\frac{1}{2}$ lb. the following year as the result of butter rationing. In subsequent years very little change took place in the domestic disappearance per capita until 1946 when short supplies made it necessary to reduce temporarily the butter ration. In 1947 the per capita disappearance moved up to 27.93 lb. as compared to 25.75 lb. in 1946. Cheese appears to have gained in popularity during the past few years, moving from 4 lb. per capita in 1942 to 5.08 lb. in 1947. During the past six years the disappearance of concentrated whole-milk products advanced from 14.01 lb. per capita to 16.51 lb. in

1947; and concentrated milk by-products moved from 3.54 lb. to 4.56 lb. All dairy products expressed in terms of milk, showed a decrease of 83 lb. per capita between 1942 and 1947.

Sales Income.—Farmers received large incomes from the sale of dairy products during the war years partly as a result of the subsidies and bonuses paid by the Government. In 1945 the income from dairying amounted to \$270,000,000 as compared with \$148,000,000 at the commencement of the War in 1939. The relationship of dairy sales income to that of total farm income was only 12 p.c. in 1926; during the course of the next four years it moved up to 24 p.c., and reached the high point of 33 p.c. in 1931. As other lines of farming became more profitable, declines in dairy sales began to develop. In 1936 this relationship fell to 24 p.c. and regardless of important advances in dairy production and prices, the 1947 income represented only 16 p.c. of the total farm income of Canada.

During the past twenty-six years, the trend in sales income from dairy products has been in two directions. In 1920 it stood at \$153,000,000; sharp declines occurred in the two subsequent years and in 1922 it amounted to only \$105,000,000. This was followed by several increases, and in 1928 it registered the highest point since 1920, when farmers realized \$121,000,000 from their dairy products. In 1930 it moved up to \$150,000,000 but, owing to exceptionally low prices in the depression period which followed, it was reduced in 1932 to a figure comparable with that of 1928. From 1933 there has been a continuous increase in income, reaching the sum of \$324,000,000 in 1947.

Value of Dairy Production.—The farm value of milk, and the total value of dairy products followed much the same pattern as that of income. The former advanced from \$222,000,000 in 1920 to \$402,000,000 in 1947; while the total value of dairy products moved up from \$289,000,000 to \$536,000,000. From 1946 to 1947 the former advanced \$48,000,000 and the latter \$112,000,000. Farm value figures shown in Tables 27 and 28, p. 380, which include sales income and income in kind, reflect the extensions that have taken place in dairy farm undertakings.

Prices of Dairy Products.*—Butter prices at the factory, which had averaged approximately 23 cents and 25 cents per lb. in 1939 and 1940, advanced to nearly 33 cents in 1941 and 53 cents in 1947. The former prices were comparable with those paid during the early stages of the First World War, but were considerably lower than those paid in 1919 and 1920 when the average was 54 cents and 57 cents, respectively. Factory cheese prices moved up from 12 and 14 cents per lb. in 1939 and 1940 to 31 cents in 1947. In 1947, the average sales income per 100 lb. of milk was \$2.37 as compared with \$2.14 in 1946, and \$1.27 in 1939. These averages were lower than those of 1920, the average for that year being \$2.17, with the exception of 1947 which was the highest on record. Plant cost of milk in 1947 was \$2.44 per 100 lb. while the farm value of milk was \$2.33 per 100 lb. and the total value of dairy production averaged \$3.11 per 100 lb. In 1939 the same items averaged \$1.14, \$0.92 and \$1.37, respectively.

* For a fuller treatment of prices and price regulations as they affect dairy production, see the report "Dairy Situation in Canada, 1946".

28.—Values of Production, Cost of Milk at Plants, and Income from Dairying, in Canada 1942-47, and by Provinces, 1946 and 1947

NOTE.—The first two columns of this table represent values based on total production, the entire milk supply being accounted for in each case. The third column is the cost of milk delivered for fluid and for manufactured purposes; while the fourth column represents the income received from the sale of milk, butterfat and dairy butter. Figures for the years 1921-41 are given at p. 21 of the report "Dairying Statistics of Canada, 1947"; for the years 1939-41 at p. 241 of the 1946 Year Book.

¹ Since the data in this table are rounded to thousands, the estimated value of farm-made cheese in the province of Prince Edward Island has been eliminated. The value of the product was \$200 in both 1946 and 1947.

Subsection 7.—Horticulture

A survey of the floriculture and nursery stock industry was conducted annually until 1943 when, as a wartime measure, it was discontinued.

Fruit Production.—The production of fruit in Canada on a commercial scale is confined to well defined areas in five provinces. In Nova Scotia production is mainly centred in the counties of the Annapolis Valley and to a lesser extent in Hants County; in New Brunswick, the counties of the St. John River Valley and Westmorland County. The fruit districts in Quebec include the Montreal area, North Shore area, the Eastern Townships and Quebec City district: in Ontario, all the counties adjacent to the St. Lawrence River and Great Lakes as far as Georgian Bay—the most famous sections being in the Niagara district: and in British Columbia the four well defined fruit areas are the Okanagan Valley, Fraser Valley, the Kootenay and Arrow Lakes section and Vancouver Island.

These areas yield large quantities of plums, peaches, apricots, cherries, strawberries, raspberries and other small fruits. A short article is given below on the production of apples; this will be followed in succeeding editions of the Year Book by short synopses of other fruits.

Apples.—Apples are the most important fruit grown in Canada, both from the standpoint of quantity and value. Apple orchards are more widely distributed than any other tree fruit because the trees are better able to withstand the extremes of temperature common in the Dominion. According to the 1941 Census there were 132,993 acres of apple trees out of a total of 177,952 acres of fruit trees of all types. Apple trees are reported in all provinces according to the Census, but production on a commercial scale is confined to Nova Scotia, New Brunswick, Quebec, Ontario and British Columbia. As is to be expected, apple orcharding had its beginnings in Eastern Canada in what was then known as New France, and recorded plantings were made in the vicinity of Quebec City about the year 1608. It was not until 1698, however, that the earliest orchards were set out. These were located near Port Royal in what is now the Province of Nova Scotia. French settlers carried trees westward as civilization spread in that direction and the first apple trees were planted about 1790 in Ontario along the Detroit River. Not until 1850 were orchards set out in British Columbia. Orchards thrived in all but the Prairie Provinces where climatic conditions were too severe. In recent years, vigorous varieties have been developed which are adaptable to conditions on the Prairies and some plantings have been made, but as yet the orchards have not reached commercial size.

According to Volume VIII of the 1941 Census, the number of apple trees in Canada was highest in 1911. In that year 16,217,176 trees were reported, and of this number 10,617,372 trees were of bearing age. The tree population has declined with each successive census until, in 1941, there were only 4,248,405 trees of bearing age and 2,316,950 others.

Production of apples has not shown the same downward trend. This is accounted for by the fact that in the earlier years many of the trees were of unprofitable varieties and were planted too close together. As the orchards grew older and more crowded they were neglected and yields fell off accordingly. With the gradual removal of these older trees and the introduction of better varieties and improved cultural practices, the production per tree has been increased. Another factor affecting the increased yield per tree is the shift of the producing areas; while the

orchards in the older fruit producing districts of Central Canada have been abandoned or badly neglected, newer areas have been developed in British Columbia, Quebec and New Brunswick.

Table 30 shows the estimated commercial quantity and value of fruit grown in Canada.

Subsection 8.—Special Agricultural Crops

Maple Sugar and Syrup.—Production of maple sugar and maple syrup is confined to the provinces of Nova Scotia, New Brunswick, Quebec and Ontario. The bulk of the crop comes from the Eastern Townships area of Quebec. This district is famous both in Canada and the United States as the centre of the maple industry. With the relaxation of price controls, prices in 1947 were substantially above those of the previous season. The price of both maple sugar and syrup was influenced to a great extent by the keen demand in the United States. The exports to that country are chiefly in the form of sugar. The large maple products processors purchase syrup from the growers and reduce it to sugar of uniformly good quality suitable for the United States market. The crop in 1947 was the largest on record and expressed as syrup amounted to 3,923,000 gallons. The value of the crop hit an all-time high of \$14,139,000.

¹ To nearest thousand.

Sugar Beets and Beetroot Sugar.—Sugar beets are grown in Quebec, Ontario, Manitoba and Alberta, six beet-sugar factories being located in these Provinces. In Quebec, sugar beets have been grown only since 1942 and production centres around St. Hilaire, south of Montreal in the Eastern Townships. The area harvested in Quebec in 1946 was 2,413 acres although the plant at St. Hilaire has a capacity to handle production from 10,000 acres. In Ontario, sugar-beet factories are located at Wallaceburg and Chatham. The acreage in Ontario has declined steadily from 38,169 in 1940 to only 9,287 in 1943. Since that year, however, the acreage has again expanded and in 1946, 23,293 acres were cropped, though production still remained well below the capacity of the two plants and only the Chatham factory processed beets in 1946. Sugar-beet production in Manitoba also declined during 1941-44. In 1940, the area harvested was 15,682 acres while in 1946 the area amounted to only 11,599 acres. The sugar-beet plant in Manitoba is located at Fort Garry. Sugar-beet production in Alberta is carried on in the neighbourhood of Raymond and Picture Butte. This area has seen a steady increase during the past six years with the acreage in 1946 amounting to 29,564 acres.

Flax.—There is an excellent market for dew-retted flax fibre in the United Kingdom. Canadian production, however, has to meet the competition of flax of equal quality from other countries where it can be produced more economically. British buyers in 1948 were paying 2 to 3 cents per lb. more than was offered during the 1946-47 season. The demand for Canadian flax in Canada has led to plans for an increase in acreage. The Canadian producer of fibre flax seed to-day is in a very favourable position.

34.—Acreages, Yields and Values of Flaxseed, Fibre and Tow, 1939-47

NOTE.—Figures for the years 1915-30 will be found at p. 284 of the 1934-35 Year Book, and for 1931-33 at p. 224 of the 1942 edition.

³ Subject to revision.

Tobacco.—The tobacco acreage expanded rapidly from the years 1943 to 1946 under the influence of an almost unlimited domestic and overseas demand. The high point was reached in 1946 when 110,358 acres produced 141,384,000 lb. of tobacco of all types. In 1947, the planted acreage again showed an increase, but, due to unseasonable weather during the spring and early frosts in September, the harvested acreage was not so large as expected. At that, 125,086 acres were cropped. Canada's largest export outlet is the United Kingdom. With the imposition of import restrictions by the United Kingdom, the market outlook was very uncertain during the growing and marketing season. The regulations were relaxed during the early winter months to allow the importation of Canadian tobacco to the value of \$6,000,000 during the 1947-48 season. Restricted imports by the United Kingdom have enabled Canadian manufacturers to build up their much depleted stocks of leaf tobacco. The low level of stocks has assisted in maintaining a high level of prices to the producer during the 1947-48 season.

35.—Acreages, Production and Values of the Commercial Crop of Leaf Tobacco, 1939-47

NOTE.—Figures for representative years 1900-28 are given at p. 228 of the 1939 Year Book, and for the years 1929-38 at p. 225 of the 1940 edition.

Apiculture.—The 1946 season was another poor honey year for the beekeepers of Eastern Canada. For the third successive year the honey crop in Ontario was smaller than in the previous season; the 1946 crop was the smallest on record. In a normal year, Ontario produces more honey than any other province, but in 1946 Alberta was the largest producer. During recent years there has been a tendency for Ontario farmers to reduce the acreage of alfalfa and clover, which are the chief nectar producing plants. It is considered that Ontario's decline in production is the direct result of this trend. A corresponding increase in acreage of alfalfa and clover has taken place in the Prairie Provinces and honey production in that area has increased accordingly.

38.—Beekeepers and Colonies, Production and Values of Honey and Beeswax, 1939-46

NOTE.—Statistics by provinces are shown in the "Quarterly Bulletin of Agricultural Statistics". Dominion totals for 1924-38 are given at p. 227 of the 1940 Year Book.

Subsection 10.—Census Statistics of Agriculture in the Prairie Provinces, 1921-1946*

Some of the major changes that have taken place in agriculture during the period 1921-46 in the provinces of Manitoba, Saskatchewan and Alberta are shown in Table 43, pp. 394-395.

The farm population, 50.8 p.c. of the total population in 1931, showed an actual decrease of 16.8 p.c. between 1931 and 1946 and represented only 42.1 p.c. of total population in the latter year. While the number of occupied farms increased by only 5.5 p.c. the number of farm operators, 60 years of age and over, increased from 22,728 to 44,878 or by 97.5 p.c. between 1921 and 1946. The number of

* Prepared under the direction of O. A. Lemieux, Director of the Census, by J. L. Forsyth, Chief, Census of Agriculture.

operators under 25 years of age, in the same period, decreased by 6.1 p.c. and between the ages of 30-39 from 81,104 to 57,748 or by 28.8 p.c. Operators reporting their age as 40-59 increased by 11.1 p.c.

Commencing shortly after the First World War, continuing through the boom of the 1920's and the depression years of the 1930's on into the Second World War, many other interesting changes took place in the agricultural picture of these three provinces. Between 1921 and 1946, the average size of occupied farms increased from 344 acres to 436 acres and the total area of farms from 87,931,804 acres to 117,538,678 acres, but whereas, about 80.8 p.c. of all farm land was owner-operated in 1921 only 65.6 p.c. was owner-operated in 1946. The area under field crops increased during this period from 32,203,306 acres to 41,695,713 acres and the area in summer fallow from 11,274,650 to 20,398,985 acres in the same period. (In 1921, idle land was included with summer fallow.)

Farm indebtedness, as covered by mortgages and agreements of sale increased from \$342,512,700 in 1931 to \$347,843,700 by 1936 but had decreased to \$159,673,500 by 1946. The number of farms reporting this debt was 109,668 in 1931 but decreased from 120,318 in 1936 to 66,846 by 1946.

Farm Population.—The definition of farm population includes all persons living on farms in both rural and urban areas. By provinces, the decreases in total farm population over the past ten years have been 13.9 p.c. in Manitoba, 24.4 p.c. in Saskatchewan and 16.1 p.c. in Alberta. During 1941-46, the population movement away from farms continued and there were 153,532 fewer persons on farms in 1946 than in 1941 compared with a decrease of 87,211 between 1936 and 1941.

Tenure and Area of Farm Holdings Analysed by Provinces.—While the total number of occupied farms in the Prairie Provinces showed a decrease during 1936-46, there was, actually, a slight increase in the number of farms in Manitoba between 1936 and 1941. Despite this over-all decrease, the total number of occupied farms was 5.5 p.c. greater in 1946 than in 1921, with Manitoba, Saskatchewan and Alberta showing increases of 2.2 p.c., 5.2 p.c. and 7.9 p.c., respectively.

There has been a definite change in the proportion of owner-operated farms to the number of all farms, during the past 25 years. A reduction from 78.5 p.c. in 1921 to 61.9 p.c. in 1946 is recorded. In 1946, 16.4 p.c. of all farms were operated by tenants as compared with 10.6 p.c. in 1921. The percentage of farms where the operator owns part of the land and rents additional land, has also increased during the same period from 10.0 to 21.3. The largest percentage increase in tenant and part-owner part-tenant operator farms occurred in Saskatchewan.

Although the total area of occupied farm land was 33.7 p.c. greater in 1946 than in 1921, there was a decrease of 2.2 p.c. in farm area between 1941 and 1946. Decreases were recorded in each of the three provinces although they are more

pronounced in Alberta. The average size of farm by province shows increases of 11.5 p.c. in Manitoba, 28.3 p.c. in Saskatchewan and 31.1 p.c. in Alberta for the 25-year period (Saskatchewan assumed the lead in size of farm in 1946). This general increase for the three provinces, however, was accompanied by a decrease in the proportion of farm land operated by the owner. Out of a total 77,064,417 acres of land farmed by owner-operators in 1946,* 21,196,683 acres or 27.5 p.c. was owned and occupied by operators who also farmed rented land as compared to 8,132,428 acres or 11.4 p.c. in 1921.*

The average area of all owner-operated farms in 1921 was 302.3 acres, whereas in 1946 the comparable figure was 320.0 acres. The design and availability of farm machinery to the needs of the small operator has stimulated the trend.

There has also been an increase in the proportion of farms in each acreage class shown in the table, with the exception of the class 101 to 200 acres. Farms of 480 acres and over accounted for 32.8 p.c. of total farms in 1946 as compared with 27.4 p.c. in 1931. The number of farms of 640 acres and over has steadily increased in each province since 1931, with Saskatchewan showing the greatest gain. The proportion of farms 101 to 200 acres, which group includes the quarter section farm, decreased from 37.2 p.c. in 1921 to 27.6 p.c. for 1946.

Farm Mechanization.—Farm mechanization has made tremendous advances during the period of the Second World War but very few farmers were able to satisfy their requirements in this respect and had to manage as best they could with their pre-war equipment, however, the figures of Table 43 (item 43) show that, for each of the provinces despite the difficulties of the War, the value of implements and machinery increased substantially between 1941 and 1946. By 1946, the supply situation had, in fact, not improved sufficiently to reflect the actual demands of farmers but agriculture enjoys a high priority rating for steel and the trend, as now shown by the Censuses of 1921 to 1946, will, there is every reason to believe, be emphasized as future figures are published.

The increase in average size of farms and in the area under cultivation has been greatly facilitated by the progress of farm mechanization. Table 44 shows an increase of 112,676 (292.8 p.c.) tractors on farms in 1946 over 1921, i.e., while there were only 15 tractors per 100 farms in 1921, there were 56 tractors per 100 farms in 1946. Automobiles and motor trucks on farms increased from 73,359 in 1921 to 184,077 in 1946. Farms in possession of a car or motor-truck increased by 159.0 p.c. in 1946, compared with 1921. While there were 20.9 p.c. fewer grain binders, and 13.9 p.c. fewer threshing machines on farms in 1946 than in 1931, the number of grain combines increased 336.9 p.c. during the 15 years: in 1946 there were 144 combines to every 1,000 farms.

* Includes area operated by managers.

Farm Values.—The total value of farm property—including implements, machinery, and live stock—was \$3,255,894,259 in 1921 and \$2,692,580,523 in 1946 a decrease of 17·3 p.c. although between 1941 and 1946 there was an increase of 38·3 p.c. The reason for this heavy decrease seems, on analysis of the figures, to be due mainly to reduction in land values.

Saskatchewan showed the greatest decrease, 25·4 p.c. in value of farm property, while Manitoba and Alberta had decreases of 21·0 p.c. and 1·1 p.c., respectively, between 1921 and 1946. Although land values showed decreases of 41·6 p.c., 38·0 p.c. and 22·6 p.c. during the 25-year period in Manitoba, Saskatchewan and Alberta, the value of farm buildings showed increases of 2·9 p.c., 3·8 p.c., and 49·1 p.c., respectively. Increases for Manitoba, Saskatchewan and Alberta, of 39·1 p.c., 26·5 p.c. and 65·3 p.c., respectively, are shown for farm implements and machinery during this period. The value of live stock on farms in Manitoba and Saskatchewan showed decreases of 6·7 p.c. and 36·2 p.c., respectively, for the 25-year period but an increase of 2·5 p.c. in Alberta.

Farm Indebtedness.—Inquiries relating to farm indebtedness, as covered by mortgages and agreements for sale, were asked in 1946 of all owner-operators, and include such debts against their buildings and land for not only farms they themselves operate but also for farms they own and rent or lease to other operators. The 1941 and earlier census indebtedness data relate only to these debts on owner-operated farms and therefore exclude any such debts on tenant-operated farms. Table 43 shows a decrease of 53·4 p.c. in debts covered by mortgages and agreement for sale between 1931 and 1946, but when the above mentioned facts are taken into consideration the actual reduction would be much greater than indicated. The largest decrease in indebtedness has occurred between 1941 and 1946. The amount of these debts decreased in Manitoba, Saskatchewan and Alberta by 51·5 p.c., 55·9 p.c. and 50·3 p.c., respectively, during the 15-year period. The number of owner-operators reporting such debts decreased by 32·3 p.c. in Manitoba, 42·6 p.c. in Saskatchewan and 36·9 p.c. in Alberta.

The amount of debts covered by liens was also reduced during the past 10 years but particularly between 1941 and 1946: 89·0 p.c. fewer operators reported 80·9 p.c. less indebtedness in 1946 than in 1936. While the amount of liens decreased by only 10·0 p.c. between 1936 and 1941, the number of operators reporting liens decreased by 13·8 p.c. The increased income to farm operators, particularly between 1941 and 1946, has enabled many operators to reduce their indebtedness incurred during the depression years.

The total value of land showed a decrease of 34·1 p.c. while that of live stock in the three provinces decreased by 17·8 p.c. The value of farm implements and machinery increased by 40·1 p.c. and building values by 15·8 p.c. between 1921 and 1946.

¹ In 1921, automobiles and motor trucks were reported together.² Not available.³ Includes some duplication for this year as farms possessing 2 sizes of tractors are included twice.

Subsection 11.—Agricultural Irrigation

A short article is given at pp. 375-379 of the 1947 Year Book on agricultural irrigation on the Canadian Prairies from its beginnings when early ranchers undertook to grow winter feed by diverting water from the smaller streams to irrigate meadow lands, to the new phase in irrigation development whereby the Federal Government, under the Prairie Farm Rehabilitation Act, 1935, undertook the construction of large irrigation works on the Prairies and to provide assistance for individual projects, conduct surveys and prepare plans for various irrigation possibilities.

Table 45 shows the larger irrigation developments in Alberta. In addition there are 640 private licensed irrigation projects with an irrigable area of 75,000 acres. Table 46 shows the principal P.F.R.A. irrigation projects in Manitoba and Saskatchewan and Table 47 the irrigable and irrigated areas in British Columbia under the control of public and private organizations.

¹ Includes other small projects.

Irrigation in British Columbia.*—The first right to the use of water for agricultural purposes in this Province was granted three months after the passing of an Act by the Imperial Government establishing the Crown Colony of British Columbia, in 1858.

Irrigation was used in these early years mainly for raising hay in valley bottom lands where it was easy to divert water out of the streams. By the end of the century, water was being conveyed to the benches and higher lands, especially where the climate and the benchlands were suitable for commercial fruit growing.

Companies were formed; large holdings were purchased and subdivided, and irrigation systems to supply them with water were constructed, largely, with earth ditches and wooden flumes. Most of these irrigation systems have since been taken over and are operated by Improvement Districts, under the Water Act, or by municipalities. To-day, the large irrigation systems of the Province are good examples of hydraulic structures. Owing to the generally rugged topography, irrigation engineering has been faced in this Province with many difficult problems; agricultural development having of necessity to follow the rather narrow valleys does not lend itself to simple and cheap irrigation systems.

* Prepared by J. E. Lane, Deputy Comptroller of Water Rights, Department of Lands and Forests, Victoria, B.C.

Due to the wide variations in climate and soil types found throughout the Province, three methods of irrigation are in use: (1) sprinkling, practised in fairly humid areas, where precipitation is moderate but insufficient during the growing period; (2) delivery by ditch or flume, with distribution over the ground by furrows, used in general for fruit and vegetable crops; and (3) irrigation by flooding, common in stock-raising areas on hay meadows.

Most of the irrigation is by gravity supply, but pumping from lakes and rivers is also practised. Pumping is costly and only warrantable in favoured areas for the growth of high-priced specialty crops.

Estimates of irrigable and irrigated land are given in the following Table. About 85,000 acres are under water licence and capable of being irrigated, nearly 100,000 acres are irrigated by individual effort, the majority being hay and grain for stock-ranches, and for field crops. In addition about 200,000 acres more could be brought under irrigation, but at a cost greater than that of existing works.

Subsection 12.—International Agricultural Statistics

The following tables are summarized from statistics published by the Office of Foreign Agricultural Relations, United States Department of Agriculture, and give, by leading countries of the world, the acreages and production of wheat for the harvests of 1946 and 1947, oats, barley and corn for 1947, with averages for the years 1935-39.

North America was the world's leading producer of wheat, in both 1946 and 1947, with about 28 p.c. and 30 p.c., respectively, of total world production. The United States alone produced 20 p.c. of the total in 1946 and 24.4 p.c. in 1947. Although a large exporter of wheat, Canada produced only 7 p.c. and 6 p.c. of the world's total in the respective years. In 1947, China, which held first place in Asia, was second in world production of wheat with 15.7 p.c. of total production followed by the Union of Soviet Socialist Republics with 15.2 p.c.

Acreages sown to wheat in 1947 showed the slight increase of 3 p.c. over those of the previous year, total production increased by only 40,000,000 bushels.

The North American Continent also leads in world production of oats and corn in 1947, with the United States producing 32 p.c. of total oats and 52 p.c. of corn. Asia was the leading continent for world barley production with 29 p.c. of the total, China contributing 14.5 p.c. The Union of Soviet Socialist Republics and the United States followed closely with 14.2 p.c. and 13.0 p.c.

48.—Estimated Acreages and Production of Wheat Harvested in 1946 and 1947 in Specified Countries, with Averages, 1935-39

The forests of Canada cover a vast region in the north temperate climatic zone, reaching from the Atlantic Ocean to the Pacific; they extend northward from the International Boundary to beyond the Arctic Circle. Wide variations in climatic, physiographic and soil conditions cause marked differences in the character of the forests in different parts of the country, whereby more or less well-defined forest regions may be recognized.

Section 1.—Forest Regions

At pp. 184-188 of the 1941 edition of the Year Book the forest regions of Canada are separately described, together with the dominant and associated tree species common to each.

Section 2.—Important Tree Species

In Canada there are more than 125 tree species of which 33 are conifers, commonly called "softwoods". While the number of deciduous or "hardwood" species is large, only about a dozen of these are of much commercial importance in the lumber trade, and about 80 p.c. of the volume of merchantable timber is made up of softwoods.

A short description of the individual tree species is given at pp. 384-387 of the 1947 Canada Year Book. For more detailed information on Canadian trees refer to the Dominion Forest Service Bulletin No. 61, "Native Trees of Canada", published by the Department of Mines and Resources, Ottawa.

Section 3.—Forest Resources

The forested area of Canada is estimated at 1,290,960 sq. miles, or 37 p.c. of the total land area. In comparison, only 16 p.c. of the land area is considered to be of present or potential value for agriculture, and only 7 p.c. is now classed as "improved and pasture". The forested area within the boundaries of the nine provinces totals 1,167,960 sq. miles, or 58 p.c. of the provincial land area. About 478,000 sq. miles of the existing forests are classed as "unproductive". They are made up of small trees which cannot be expected to reach merchantable size because they are growing on poorly drained lands, or at high altitudes, or are subject to other adverse site conditions. These unproductive forests, however, perform

* Sections of this Chapter that deal with forestry and forest administration have been prepared by the Economics Division, Dominion Forest Service, Department of Mines and Resources. Sections dealing with forest utilization and forest industries, except as otherwise noted, have been revised under the direction of W. H. Losee, Director, Census and Merchandising Division, Dominion Bureau of Statistics, by L. J. Pouliot, Chief, Forest Products Statistics.

valuable functions. They help to protect watersheds and conserve water supplies; they provide fuel and building materials to natives and travellers in remote areas; and they are the habitat of valuable fur-bearing and game animals.

The productive forests covering more than 813,000 sq. miles are considered capable of producing continuous crops of timber suitable for domestic and industrial purposes. A considerable proportion of these forests is not yet accessible for commercial operations, but constitutes a valuable reserve for the future. About 435,000 sq. miles of productive forests are considered to be economically accessible at the present time. One-half of the productive forest area bears trees large enough for use as sawlogs, pulpwood or fuelwood, and the other half is occupied by young growth of various ages, kinds and degrees of stocking.

The total stand of timber of merchantable size is estimated to be 311,201,000,000 cu. ft., of which 191,347,000,000 cu. ft. is accessible. These cubic volumes are volumes of wood that can actually be used. Expressed in commercial terms, the accessible timber is made up of 250,250,000,000 bd. ft. of logs in trees large enough to produce sawlogs and 1,684,710,000 cords of smaller material suitable for pulpwood, fuelwood, posts, mining timbers, etc.

Since the end of the War there has been increased interest and activity in forest inventory surveys, particularly on the part of the Provincial Governments. The work is being greatly facilitated by the use of air survey methods. These prove of great value both in the preparation of the basic maps and for the actual forest inventory information.

Section 4.—Forest Depletion and Increment

The purpose of this Section is to present a general account of depletion and increment. Details of the scientific control of those influences that account for wastage, viz., forest fires and insect pests, are dealt with in the section on Forest Administration at pp. 412-418. A special article on Noxious Forest Insects and Their Control appears at pp. 389-400 of the 1947 Year Book.

Depletion.—The average annual rate of depletion of reserves of merchantable timber during the ten years 1936-45, by cause, is given in Table 2. Of the total depletion, 74 p.c. was utilized and 26 p.c. was destroyed by fire, insects and disease. The utilization of 2,443,225 cu. ft. comprised 38 p.c. as logs and bolts, 29 p.c. as pulpwood, 29 p.c. as fuelwood, and the remaining 4 p.c. as miscellaneous products. Approximately 7 p.c. of the utilization was exported in unmanufactured form.

One factor that indirectly affects forest depletion is the more efficient utilization of timber that has been cut. There is little doubt that in the past altogether too high a percentage of the hewn logs has been discarded. Changes of great significance are taking place in the uses of wood that permit of the utilization of sizes and qualities that are unmerchantable as sawn lumber. The development of the cellulose industry in the manufacture of rayon, cellophane and numerous other products, is rapidly extending the use of wood. Plastic wood products, fibre board and laminated wood will undoubtedly provide an increasing demand for the so-

called inferior classes of wood so that more complete utilization of the forest resources through the elimination of much of the waste that now occurs can be expected. (See Section 6, pp. 418-420, on Forest Utilization.)

2.—Average Annual Forest Depletion During the Period 1936-45

Annual Wastage.....	853,547	100.0	25.9
Annual Depletion.....	3,296,772	—	100.0

Increment.—Practically all of the depletion or drain on the forest is concentrated in the 435,000 sq. miles of productive forest which is classed as accessible, and replacement of normal depletion by this area alone requires an average annual growth rate of about 12 cu. ft. per acre. Complete estimates of the rates at which the forests of Canada grow are not yet available. The vast size of the country, the diversity of growing conditions, and the complex character of the forests themselves, place great difficulties in the way of estimating growth. Numerous studies have been made by the Dominion Forest Service which indicate, beyond reasonable doubt, that over considerable tracts annual growth exceeds 25, 30 or even 40 cu. ft. per acre per annum; however, there are other areas classed as productive on which the growth is much less.

Natural reproduction of forest tree species in Canada is fortunately prolific except in a few localities. After an area has been cut over or burned, young growth usually appears within a short time. Thus the re-establishment of some sort of forest growth is a less difficult problem than it is in many other countries. There is, however, no guarantee that the species reproduced will be of the kinds desired by industry. Most of the wood used in Canada is softwood and, in general, softwood reproduction is fairly good; but there are considerable areas in which a combination of overcutting and repeated fires have resulted, not in the permanent destruction of the forest, but in the replacement of valuable stands by new ones of inferior type.

Many stands of 'second growth' that have come up after cutting or fire are now reaching merchantable size and are beginning to attract attention. Anticipating the need for practical guidance in the management of these accessible young forests, the Dominion Forest Service is devoting the major efforts of various forest experiment stations to the improvement of the quality and the acceleration of the growth of young stands that nature has established. Operators, too, are showing more interest in putting their operations on a self-sustaining basis and working plans are being developed with this in view.

There is no room for doubt that the introduction of better methods of forest management, including the provision of more adequate forest protection, can make the forests of Canada more productive than they have ever been. It is true that stocks of very large trees, whose growth required upwards of 300 years, are disappearing and will not be replaced; but, though the forest industries of the future must use smaller logs than did those of the past, good forest management can make possible a considerable expansion of those industries when market conditions warrant.

The potential capacity of many forest soils to produce more usable wood in a given period than they have ever done in the past is already being demonstrated on such areas as the Dominion Forest Experiment Station at Petawawa, Ont., and on some of the better-managed farm woodlots.

Section 5.—Forest Administration

Subsection 1.—Administration of Federal and Provincial Timber-Lands

The forest resources of Canada as a whole are owned and administered by the provinces. The Federal Government, however, is responsible for the administration of those of the National Parks, Forest Experiment Stations, and Yukon and the Northwest Territories.

The general policy of both the Federal Government and the Provincial Governments has been to dispose of the timber by means of licences to cut, rather than to sell timber-land outright. Under this system, the State retains ownership of the land and control of the cutting operations. Revenue is received in the form of Crown dues or stumpage (either in lump sums or in payments made as the timber is cut); ground-rents and fire-protection taxes are collected annually. Both ground-rent and Crown dues may be adjusted at the discretion of the Governments.

The Maritime Provinces did not adopt this policy to the same extent as did the rest of Canada. In Prince Edward Island practically all the forest land has been alienated and is in small holdings, chiefly farmers' woodlots. In Nova Scotia 71 p.c. of the forest land is privately owned; nearly one-half of this is in holdings exceeding 1,000 acres. In New Brunswick nearly 50 p.c. is under private ownership. The percentages of privately owned forest land in the other provinces are as follows: Quebec, 7.2 p.c.; Ontario, 6.0 p.c.; Manitoba, 12.7 p.c.; Saskatchewan, 11.9 p.c.; Alberta, 7.7 p.c.; and British Columbia, 3.4 p.c.

3.—Forest Reserves in Canada, by Provinces, 1947

NOTE.—Areas of National Parks (which are also forest reserves) are not included in this table, but may be found at pp. 33-35.

Province	Dominion Forest Experiment Stations	Provincial Forest Reserves	Total
	sq. miles	sq. miles	sq. miles

British Columbia.....			
Totals.....	202.11	89,191.57	89,393.68

¹ Under National Park reservation and therefore not included in total.

Forest Lands under Federal Control.—The forests under Federal control are administered by the Department of Mines and Resources. The National Parks Bureau has charge of the National Parks, and the Bureau of Northwest

Territories and Yukon Affairs administers the timber in those areas. The Indian Affairs Branch administers, in trust for the Indians, the timber within their reservations. The Dominion Forest Service has charge of the Forest Experiment Stations.

Timber Control.—An outline of the controls applied to meet the dislocation in the lumber industry during the war years is given at pp. 277-280 of the 1946 Year Book. Since the end of the War, the domestic demand for lumber for all purposes including construction, railway maintenance and general industrial use, has been extraordinarily high and export demand has also reached unprecedented heights. The 1947 production is estimated at 5,346,000,000 feet b.m. Of this amount it is estimated that 2,600,000,000 feet b.m. were retained for domestic requirements. The high rate of production was made possible by an increase both in number and in efficiency of the labour force available to all branches of the industry.

To ensure adequate supplies for domestic housing and industrial requirements, controls were continued throughout 1947 on the export of lumber, poles, railway ties, plywood, veneers, pulpwood, doors, flooring and other millwork. Prices were decontrolled on Sept. 15, 1947, and, while upward adjustments resulted from this action, prices quickly stabilized at levels consistent with increased costs of production. Decontrol of both price and distribution of fuelwood was effected as ample supplies were available. Although price control on pulpwood was also discontinued, control was maintained on the export of this item to ensure equitable distribution for both domestic mills and foreign markets.

Forestry and FAO.—Canada has undertaken to co-operate in the forestry work of the Food and Agriculture Organization of the United Nations. The functions of the Organization as they concern forestry are outlined at pp. 264-265 of the 1946 Year Book.

Forest Lands under Provincial Control.—With the exception of relatively small areas owned by the Federal Government, the Crown lands and the timber on them are administered by the provinces in which they lie. As new regions are explored, their lands are examined and the agricultural land disposed of. Land suitable only for forest is set aside for timber production, and the policy of disposing of the title to lands fit only for the production of timber has been virtually abandoned in every province of Canada. Efforts are being made, especially in Quebec and Ontario, to encourage the establishment and maintenance of forests on a community basis. Information regarding forest administration in the individual provinces is given at pp. 234-236 of the 1942 Year Book.

Recent Royal Commissions on Forestry.—*British Columbia.*—In 1944, a Royal Commission on Forestry was established by the Province of British Columbia with Mr. Justice (now Chief Justice) Gordon Sloan sitting as sole Commissioner. Over a period of two years the Commission held a series of hearings and received representations from the Government, the forest industries, and the public. In his report, the Commissioner presented a review of the whole forest situation in the Province; a number of the recommendations were implemented by legislation shortly after the report was presented. One recommendation which the Government considered unacceptable was that the administration of the forest resources of the Province should be placed in the hands of a more or less independent commission. It was the view of the Government that administration should continue to lie with the Department of Lands and Forests.

As a direct result of the report, the Forest Act was amended by the Legislature in 1947, giving the Minister power to enter into an agreement, described as a forest management licence, with any person for the management of Crown lands specified in the agreement and reserved to the sole use of the licensee for the purpose of growing continuously and perpetually successive crops of forest products. This important advance in forestry legislation will undoubtedly lead to great improvement in forestry practice in the Province.

Saskatchewan.—In 1945 the Province of Saskatchewan appointed a Royal Commission, under the chairmanship of Mr. Frank Eliason, to inquire into and report upon matters relating to the forest resources and industries in Saskatchewan. During the course of the investigations two interim reports were published recommending more adequate fire protection and severe penalties for infractions of forest protection regulations. Recommended also was the curtailment of the annual cut on forest areas under provincial control to an amount roughly approximating one-twentieth of the estimated stand of merchantable spruce timber in each particular area. It was urged that a proper detailed forest inventory be made as soon as possible so that the amount of allowable cut for succeeding years might be more accurately estimated on a sustained-yield basis.

In their final report, the Commission recommended that the management of the forests remain under direct control of the Minister and that an advisory board be appointed to promote forest conservation. Recommended also were the establishment of at least one nursery growing white spruce and jack pine and one experimental forest farm unit.

A new policy of timber disposal now replaces the old practice of selling timber on a stumpage basis with a system of cutting and processing timber by contract. All timber for resale from Crown lands remains the property of the people of the Province, and is turned over at railhead to the Saskatchewan Timber Board for marketing.

Ontario.—An Ontario Royal Commission on Forestry was appointed in 1946, under Major-General Howard Kennedy, C.B.E., M.C., as sole Commissioner, to investigate all phases of Ontario's forest industries and to work out a comprehensive policy towards the attainment of "total forestry" which was defined by the Commissioner as "the complete utilization of the forest resources of the Province for the greatest use and enjoyment of its people".

All field work was carried out during the one summer, and the woods operations of every large and medium-size industrial concern in the Province were visited and reported on. Public hearings were held in eleven centres where 142 briefs were presented.

The inquiry resulted in the compilation of most complete and up-to-date information on the methods, processes and equipment of the forest industries of Ontario and the resources which supply them. The report which the Commissioner submitted to the Government proposed radical changes in methods of timber administration in Ontario. He recommended the pooling of all Crown forest resources and their redistribution into twelve areas which would be controlled by Forest Operating Companies. All woods operations within each area would be combined and co-ordinated to the best advantage of the individuals or corporations holding shares in the Operating Company. In order to provide continuity of

forest policy through successive governments, an Advisory Committee to the Minister of Lands and Forests was recommended with representation from industrial, financial, labour, educational and professional groups.

An extensive reforestation program was recommended for an estimated 2,500,000 acres of wasteland. Commencing in five years' time, the program would involve 100,000 acres annually for ten years, the remainder of the area to be planted in the following ten-year period at the rate of 150,000 acres per annum.

The Commissioner advised a widely expanded road-building program, with a view towards the opening up of every major watershed. Unless this were done it would be impossible to obtain maximum output from the forest areas, or develop them to the best advantage for recreational and tourist activities.

Measurement of timber by the Doyle Rule was considered obsolete, and it was proposed that all wood, whether logs or bolts, be measured on a cubic unit basis. It was recommended also that the standard cord, as set out in the Dominion Weights and Measures Act, be adopted.

Pulpwood agreements, both export and domestic, should be reviewed and adjusted so that the permissible annual cuts might correspond with the probable annual growth on the areas involved.

The Commissioner proposed that future Government policy be inclined in favour of the lumber industry rather than against it, as would appear to have been the case during the past decade. He urged also that policy should be aimed toward the attainment of the highest possible degree of manufacture within the country.

Other Provinces.—In the five other forest provinces, although formal public inquiry has not been considered necessary, forestry problems are receiving close attention from governments and from industry, and steps are being taken to improve and strengthen administrative and protective services.

Subsection 2.—Forest-Fire Protection

The Federal Government is responsible for fire-protection measures in the forests under its administration. Each of the Provincial Governments, except that of Prince Edward Island, maintains a fire-protection organization co-operating with owners and licensees for the protection of all timbered areas, the cost being distributed or covered by special taxes on timber-lands. In each province, with the exception just mentioned, provincial legislation regulates the use of fire for clearing and other legitimate purposes, and provides for close seasons during dangerous periods. An interesting development in this connection in the Province of Quebec is the organization of a number of co-operative protective associations among lessees of timber-limits. These associations have their own staffs, which co-operate with those of the Board of Transport Commissioners and the Provincial Government. The latter contributes money grants, and also pays for the protection of vacant Crown lands lying within the area of the associations' activities.

In the matter of forest-fire protection along railway lines, the provincial services are assisted by the Dominion Railway Act administered by the Board of Transport Commissioners. This Act gives to that body wide powers relating to fire protection along railway lines under its jurisdiction. Certain officers of the various forest authorities are appointed ex-officio officers of the Board of Transport Commissioners and co-operate with the fire-ranging staffs which the railway companies are required to employ under the Dominion Railway Act.

In many districts in Canada, radio-equipped aircraft are used to good effect for the detection and suppression of forest fires. Where lakes are numerous, seaplanes or flying boats can be used for detection, and for the transportation of fire-fighters and their equipment to fires in remote areas. In Western Canada, equipment and supplies are sometimes dropped by parachute to isolated fire crews; in one province parachutists are now employed to fight fires which are difficult of access by other means.

In the more settled areas with better transportation facilities, fire detection is carried out by means of lookout towers fitted with telephone or radio for reporting fires. Field staffs and equipment are maintained at strategic points ready to deal with fires when they are reported. These staffs, when not engaged on fire control duties, are employed on the construction and maintenance of roads, trails, telephone lines, fire guards and other necessary improvements.

Portable gasoline pumps, which usually weigh between 60 and 100 lb. each, and linen hose are important equipment. These pumps can be carried to a fire by canoe, motor-boat, automobile, aircraft, pack-saddle or back-pack and can provide hose pressures up to 200 lb. per square inch, depending upon the elevation above and distance from the water supply. Hose lines over a mile in length are frequently used. Small hand-pumps supplied by 5-gallon portable containers are also used effectively in many cases. Tractors equipped with bulldozers or ploughs are commonly used for fire-line construction. In some regions, trucks fitted with water tanks and power pumps are employed for the control of fires adjacent to roads.

In addition to these improved measures, the enactment of legislation has tended to reduce the fire menace. The establishment of close seasons for brush-burning, and seasons during which permits are required for setting out fires and for travel in the forests during dangerous dry periods, have been of enormous value as preventive measures. Education of the public as to the need for care with fire is, however, the basic method of reducing the large number of fires which occur each year as a result of man's negligence.

Another important advance in forest protection is the development by the Dominion Forest Service of methods for the daily measurement of the actual degree of forest-fire danger. In the forest types and regions in which the necessary research has been completed the forest authorities are able, not only to gauge the trend of increasing fire danger at any given time but, by the aid of weather forecasts, to anticipate the trend one or two days in advance and so regulate their activities to meet hazardous conditions as they develop. Increased attention is being devoted to the scientific planning of fire-control operations so as to achieve adequate protection at minimum cost.

The various governmental forest authorities conduct forest conservation publicity work independently and in co-operation with the Canadian Forestry Association. Since its beginning in 1900, that Association has played an important part in securing popular co-operation in reducing the fire hazard. By means of its magazine, which has a large circulation, by railway lecture cars and motor-trucks provided with motion-picture equipment, and by co-operation with radio broadcasting stations and the press, the Association reaches a large proportion of the population of the Dominion. Special efforts are made through the schools, by

specially appointed junior forest wardens and other means, to educate the younger generation as to the value of forests, the devastation caused by fire and the means of preventing such destruction.

Forest-Fire Statistics.—Although the number of forest fires in 1946 was slightly greater than the average for the previous ten years, the total area burned and the estimated values destroyed were less than one-half the average figures. Forest-fire losses in the Maritime Provinces were somewhat higher than normal; elsewhere, the damage caused by forest fires was well below the average.

Summary statistics of fire losses are given in Tables 4 and 5, which include for the first time reports from the Yukon and the Northwest Territories. Fuller details by regions are given in the Annual Report of the Department of Mines and Resources for the year ended Mar. 31, 1947.

Subsection 3.—Scientific Forestry

The great forestry problem is the management of Crown forests, first under provisional and later under more intensive working plans, so as to ensure a sustained yield. Forest research activities in this direction are now assuming great importance. The Dominion Forest Service of the Department of Mines and Resources operates five forest experiment stations with a total area of 227 sq. miles.* Here investigations of the underlying principles governing the growth of forests and improvement in the rate of increment are made and practical methods of management tested.

About 600 technically trained foresters are employed by the Dominion, by provincial forest services or by pulp, paper, and lumber companies. A number of foresters are actively engaged in commercial logging operations and, in addition to administrative work, these men carry on forest surveys either for the estimation of timber-stands and making of maps, or to determine natural growth and reproduction conditions and factors.

Through the use of air photographs taken largely by the Royal Canadian Air Force and base maps prepared by the mapping organizations of the Departments of Mines and Resources and National Defence, the Dominion Forest Service has taken a leading part in the development of methods for the interpretation of air photographs for forestry purposes. Provincial forest services and timber holding companies are accelerating their use of air photographs. It is now possible not only to delineate the different forest types, but also to obtain from air photographs information that facilitates the preparation of quantitative timber estimates, and greatly reduces the amount of groundwork required. Aerial photographs drawn to scales suitable for mapping purposes covering upwards of 1,000,000 sq. miles are now available in the National Air Photographic Library of the Department of Mines and Resources, and about 135,000 sq. miles of forest have been mapped and classified from the photographs. Still greater use of air photographs for forestry purposes is expected in future.

* See Table 3, p. 409.

Specialized work in silvicultural research and problems connected with forest utilization are carried on by the Forest Service of the Department of Mines and Resources. On the other hand, the Department of Agriculture conducts specialized research work in the fields of forest pathology and forest entomology. Details of the programs of work under each heading follow.

Sylvicultural Research.—Research in the field of silviculture is centred in five Dominion Forest Experimental Stations located in New Brunswick, Quebec, Ontario, Manitoba and Alberta, but supplementary studies are conducted in other areas in co-operation with the Provincial Governments and with industry. The purpose of this work is to keep all forest lands in continuous production and to obtain the highest possible volume of timber of good quality within a shorter period of time than is permitted by the unaided operations of nature, and at a cost that is economically feasible. Problems of regeneration, methods of cutting and tree breeding—by selection and developments of superior strains for artificial propagation—are dealt with.

Forest Products Research.—Research in this field is carried out by the Forest Products Laboratories of Canada operating in two centres—Ottawa and Vancouver. The Ottawa Laboratory conducts general research in lumber seasoning, timber mechanics, timber physics, timber pathology, wood preservation, wood chemistry and wood utilization. The Vancouver Laboratory is located on the campus of the University of British Columbia, and provides research facilities for the British Columbia forest industries to study problems pertaining to the industry in that section of the country.

Pulp and paper research is carried on at the Pulp and Paper Research Institute of Canada at Montreal and is organized under a co-operative agreement between the Federal Government, the Canadian Pulp and Paper Association and McGill University. The work of the Institute is under the control of a Joint Administrative Committee consisting of representatives of the three parties concerned. The program of work includes woodlands research and refers to investigations in the Division of Industrial and Cellulose Chemistry of McGill University.

Forest Pathology.*—Forest pathology is that branch of the science of botany which deals with disease in forest trees with the object of preventing or controlling such disease. It includes the study of all forms of loss in the forest except those caused by fire and insects. The study of disease in shade and ornamental trees and of decay of wood in service are branches of forest pathology.

Owing to the low value per unit area of forest growth and the long-time element necessary for the crop to mature it is not economically feasible to make large direct expenditures for the prevention or control of disease. The situation here is entirely different from that which obtains in regard to agricultural crops where the comparatively high value of the crop and the short rotation permit the economic application of direct control and cultural methods, such as spraying, dusting, irrigation, cultivation and fertilization. It is only in the case of forest nurseries and ornamental individuals of high value that such measures can be applied to trees. In practice forestry control of disease is accomplished principally by the selection of a rotation which provides for harvesting the crop before loss from decay becomes serious and by the elimination of undesirable and diseased individual trees at the time of thinning

* Prepared in the Division of Botany and Plant Pathology, Department of Agriculture, Ottawa.

and of final cutting. If these and other measures are based upon adequate knowledge the incidence of indigenous disease can be kept within tolerable limits. On the other hand diseases that have been brought in from foreign countries, such as white pine blister rust, Dutch elm disease, and chestnut blight, must be controlled largely by direct methods such as the eradication of alternate hosts and the removal of infected trees.

In Canada investigations in forest pathology are carried on by the Federal Government in the Division of Botany and Plant Pathology, Science Service Branch, Department of Agriculture. In addition to the staff at Ottawa, field laboratories are maintained at Fredericton, N.B., Toronto, Ont., and Victoria, B.C. It is likely that a laboratory to serve the Prairie Provinces will be established during 1948. No work in forest pathology is done by any of the provinces except Quebec which maintains its own service.

Forest Entomology.—The study of forest insect problems in Canada is entrusted to the Forest Insect Investigations Unit of the Division of Entomology, Science Service, Department of Agriculture. Laboratories are maintained at Ottawa, Ont.; Sault Ste. Marie, Ont.; Fredericton, N.B.; Winnipeg, Man.; Indian Head, Sask.; Vernon, B.C.; and Victoria, B.C. In addition there are four sub-laboratories and a number of temporary field stations and camps. In conjunction with various government and commercial agencies surveys are made, the results of which are collated at Ottawa. Fundamental studies, which are purely scientific, are then made with a view to understanding relationships underlying fluctuations in insect population. It is anticipated that all these studies will in future be made at Sault Ste. Marie, Ont. Other functions of the Division are those dealing with emergency projects and control operations. When sudden and spectacular outbreaks of insects cause public alarm the Division of Entomology is called upon for remedies; as these are applied a thorough study of the bionomics of the species involved is made. Control operations are classified as sylvicultural, biological, chemical and mechanical. Sylvicultural and biological methods offer the best solution for the majority of forest-insect problems.

In order to salvage infested areas forest entomologists study all outbreaks to determine the condition of the forest, the severity of the attack, the probable rate of future infestation, and the rate of deterioration of timber subsequent to death from insect attack. A regular system of reporting by companies and forest services has been developed for this purpose and prognostications and recommendations are made on the basis of the reports.

To prevent the introduction of insect pests from other countries, the Plant Protection Division of the Department of Agriculture is authorized by the Destructive Insect and Pest Act to examine at certain specified ports all importations of trees and to issue clearances if satisfied that the trees are free from contamination.

A more detailed analysis of the activities of the Forest Insect Investigations Unit is given in a special article entitled "Noxious Forest Insects and Their Control", which appears at pp. 389-400 of the 1947 edition of the Year Book.

Forest Insects Control Board.—The mounting loss and damage through forest insects in Canada is a matter of great concern to governments and the forest industry in this country. In particular, the present uncontrolled epidemic of spruce budworm threatens the loss of raw materials on a scale approaching a national disaster.

To meet this situation an Order in Council was passed by the Federal Government on Sept. 14, 1945, setting up a Forest Insects Control Board which operated under the Department of Reconstruction and Supply until Jan. 1, 1948, when it was transferred to the Department of Mines and Resources. The Board is composed of ten members, one of whom is chairman, and includes representatives from the Departments of Reconstruction and Supply, Mines and Resources, and Agriculture, also one member from the pulp and paper industry, one member from each of the Provinces of British Columbia, Ontario and Quebec, one member to represent the three Maritime Provinces, and one member from Manitoba who represents the three Prairie Provinces.

The creation of the Forest Insects Control Board did not involve the taking over or replacement of any existing service, entomological or otherwise. Its purpose was to secure additional funds where necessary, and to supplement the functions of existing Federal and provincial agencies and co-ordinate their several efforts into one cohesive program with a view to expediting the solution of the forest insect problem in Canada.

Section 6.—Forest Utilization

Forest utilization is concerned with the broad group of industries that include the hewing down of timber in the forest and the transforming of it into the many utilitarian shapes and forms required by modern standards of living. Thus they provide the raw material for sawmills, pulp and paper mills and for the still wider range of secondary industries that take the products of these basic industries and convert them into more highly manufactured goods such as veneers and plywoods, sash and doors, furniture and all the vast range of industries that use wood in any form in their processes. The Manufactures Chapter cannot do more than treat these industries in their relationship to all industry, but the purpose here is to relate them to the primary resources of the forest. These industries, especially the pulp and paper industry and the lumber industry, contribute substantially to the value of Canada's export trade and thereby provide the exchange necessary to pay for a large share of the imports that have to be purchased from other countries, particularly the United States.

Subsection 1.—Woods Operations

In connection with operations in the woods, it should be borne in mind that the forests not only provide the raw material for the sawmills, pulp-mills, wood distillation, charcoal, excelsior and other plants, but that they also provide logs, pulpwood and bolts for export in the unmanufactured state, and fuel, poles, railway ties, posts and fence rails, mining timber, piling and other primary products, which are finished in the woods ready for use or exportation. There are also a number of minor forest products, such as Christmas trees, maple sugar and syrup, balsam gum, resin, cascara, moss and tanbark, that go to swell the total.

It has been estimated that operations in the woods in Canada in 1946 gave employment during the logging season amounting to 41,638,000 man days, and distributed \$277,000,000 in wages and salaries.

6.—Values of Woods Operations, by Products, 1941-46

7.—Wood Cut in Operations in the Woods, Equivalents in Merchantable Wood and Total Values, by Chief Products, 1945 and 1946, with Comparative Totals, 1936-44

NOTE.—Details by chief products and by provinces for the years 1926-45 will be found in the "Annual Estimate of Operations in the Woods, 1945", published by the Forestry Branch, Dominion Bureau of Statistics. A change in computing the converting factor was introduced in 1944-45 and is described at p. 265 of the 1946 Year Book.

Subsection 2.—The Lumber Industry

The manufacture of sawn lumber is the second most important industry in Canada depending on the forest for its raw materials.

The total number of sawmills, tie, shingle, lath, veneer, stave, heading and hoop mills and mills for cutting-up and barking or rossing of pulpwood that reported in 1946 was 6,001, as compared with 5,295 in 1945. Employees numbered 49,352 and wages and salaries amounted to \$63,811,260. The logs, bolts and other materials and supplies of the industry were valued at \$156,107,527, the gross value of production was \$287,910,057 and net production \$129,408,392.

Lumber production in Canada reached its maximum in 1946 at almost 5,083,280,000 ft. b.m. Average values were fairly uniform up to 1916, but increased rapidly from 1917 to 1920, only to decline gradually during the following years to the lowest level for the entire period, which was reached in 1932. With the exception of 1938, increases took place each year from 1933 to 1946.

Subsection 3.—The Pulp and Paper Industry

The rapid development of this industry in Canada is traced briefly at p. 265 of the 1940 Year Book. Summary statistics for the combined pulp and paper industries are given at pp. 426-427 of this volume.

There are three classes of mills in the industry. These, in 1946, numbered 31 making pulp only, 56 combined pulp and paper mills and 26 making paper only.

The industry in Canada includes three forms of industrial activity, operations in the woods with pulpwood as a product, the manufacture of pulp and the manufacture of paper. Some of the important pulp companies operate sawmills to utilize the larger timber on their limits to the best advantage, and some lumber manufacturers divert a proportion of their spruce and balsam logs to pulp-mills. Less than one-fifth of the pulpwood cut in Canada is exported in raw or unmanufactured form and a large proportion of such exports is cut from private lands.

12.—Production, Consumption, Exports and Imports of Pulpwood, 1937-46

NOTE.—Figures for earlier years will be found in the corresponding table of previous Year Books.

¹ All quantities are given in terms of rough or unpeeled wood.
per cent.

² Less than one-tenth of one

The manufacture of pulp is the second stage in this industry. This is carried on by mills producing pulp alone and also by paper manufacturers operating pulp-mills in conjunction with paper-mills to provide their own raw material. Such mills usually manufacture a surplus of pulp for sale in Canada or for export. Spruce, supplemented by balsam fir in the east and by hemlock in the west, is the most suitable species of wood for the production of all but the best classes of paper.

The preliminary preparation of pulpwood is frequently carried on at the pulp-mill, but there are also a number of 'cutting-up' and 'rossing' mills operating on an independent basis, chiefly for the purpose of saving freight on material cut at a distance from the mill or on material intended for exportation. Pulpwood is measured by the cord (4' by 4' by 8' of piled material). One cord of rough pulpwood contains approximately 85 cu. ft. of solid wood, and one cord of peeled pulpwood 95 cu. ft.

Pulp Production.—Of the total 1946 pulp production 74 p.c. was made in combined pulp and paper mills for their own use in manufacturing paper. The remainder was made for sale in Canada or for export. Over 60 p.c. was groundwood pulp and over 18 p.c. unbleached sulphite fibre, these two being the principal components of newsprint paper. Bleached sulphite, bleached and unbleached sulphate, soda fibre and groundwood and chemical screenings made up the remainder. A considerable market has developed for screenings in connection with the manufacture of rigid insulating boards.

The manufacture of the 6,615,410 tons of pulp produced in 1946 entailed the use of 8,684,756 cords of rough pulpwood valued at \$154,581,001 and the equivalent of 95,171 rough cords of other wood (i.e., sawmill chips, slabs and edgings, sawdust, butt cores, etc.) valued at \$1,706,725. The total value of materials used in the manufacture of pulp was \$176,798,465.

Since 1913 Canada has led the world in the export of newsprint. In 1938 the quantity of newsprint exported by the principal newsprint-producing countries was 3,806,737 short tons, of which Canada contributed 63.7 p.c. World comparisons for later years are not available.

World Newsprint Statistics.—During the war years world figures of newsprint production and exports were not, of course, obtainable. However, production figures for the leading producing countries have again become available from the Newsprint Association of Canada and are given for 1946 in Table 20. The 1939 figures are also included for comparative purposes. Figures for post-war exports of newsprint from those countries are still unavailable.

¹ Slightly lower than Bureau of Statistics figures given in Table 17 because of the exclusion of certain paper not classed as newsprint by the Association.

Statistics of the Combined Pulp and Paper Industries.*—The manufacture of pulp, the manufacture of paper and the manufacture of products made of paper may, under certain conditions, be treated as three industries, for they are frequently carried on in separate plants by entirely independent companies. The manufacture of basic stock and the converting of this paper into towels, stationery and other highly processed paper products are often combined in one plant. This

* See Chapter XVI and the Index for further particulars regarding the pulp and paper and paper-converting industries.

further converting of paper within the pulp and paper industry itself represents only a small part of Canada's production of converted paper and boards, the bulk of which is still made in special converting mills classified in other industrial groups.

The presence of these different combinations in one mill makes it difficult to separate many of the statistics relating to the manufacture of pulp, basic paper and converted paper products. All converting operations carried on in paper mills in this industry are attributed to the particular industrial group of converting plants to which they properly belong. Including manufacturing operations as far as the basic paper-making stage, there were altogether 113 mills in operation in 1946. The employees numbered 44,967 and their salaries and wages amounted to \$101,364,636. If the pulp made for their own use in combined pulp and paper mills is disregarded, the total of materials and supplies used in the industry as a whole can be considered as amounting to \$223,448,338 in 1946, \$179,369,499 in 1945 and \$157,995,141 in 1944; the gross value of production as \$527,814,916 in 1946, \$398,804,515 in 1945 and \$369,846,086 in 1944; and net value of production, \$258,164,578 in 1946, \$180,401,885 in 1945 and \$174,492,103 in 1944.

The pulp and paper industry is one of the leading single manufacturing industries in Canada. During the war years certain other industries rose temporarily to higher positions, but the pulp and paper industry has now resumed its former place. In 1946 it was first in net value of production, in gross value of production and in salaries and wages paid, and second in employment. Only the manufacturing stages of the industry are considered in these comparisons, no allowance being made for capital invested, men employed, wages paid or primary products sold in connection with the woods operations. These form an important part of the industry as a whole but cannot be separated from woods operations carried on in connection with sawmills and other industries. In world trade, generally speaking, pulp and paper are Canada's main commodities; usually greater than wheat and far greater than nickel. Newsprint alone, over a considerable period, has brought Canada more export dollars than wheat, nickel or any other single commodity.* The United States market absorbs, annually, practically all pulpwood exports and over 80 p.c. of the pulp and the paper shipments of Canada. About one-half of the paper consumed in the United States is either of Canadian manufacture or is made from wood or wood-pulp imported from Canada.

Subsection 4.—The Veneer and Plywood Industry†

The Canadian veneer and plywood industry has enjoyed phenomenal growth during the past decade. Plywood production has quadrupled since 1939 and similar increases have been made in the production of veneer.

Plywood is manufactured in Canada from both softwoods and hardwoods. The softwood plywood industry is centred chiefly on the West Coast where Douglas fir is the main species used. The first plywood plant in British Columbia commenced operations in 1912. Subsequently other plants were opened for the production of fir plywood and now Canada's annual production of softwood plywood is measured in terms of several hundred million square feet.

* For reasons given in Section 1, Part II of Chapter XXI, gold is excluded from Canadian trade statistics.

† Prepared by the Forest Products Laboratories, Dominion Forest Service, Department of Mines and Resources, Ottawa.

In Eastern Canada the mills concentrate on the production of hardwood veneers and plywoods. Birch is the most important species but maple, elm, basswood and other hardwoods are also used to a lesser extent. The very urgent demand for aircraft plywood during the Second World War greatly stimulated hardwood plywood production. Prior to 1939 practically the entire output was produced by cold-press methods but war requirements for resin-bonded plywood resulted in the production of high-quality plywood for the exacting requirements of the aircraft industry. The production of aircraft plywoods alone rose to approximately 35,000,000 sq. ft. annually in the last two years of the War.

In the post-war period a number of plants have materially increased their output of both softwood and hardwood veneers of high quality. In Eastern Canada alone there are now 24 plants producing veneer and plywood and a number of others are being built to supply the increased demands of export markets.

The use of plywood is expanding as its properties are becoming more widely appreciated. It is replacing solid wood construction in the furniture and allied industries for core stock, flooring, concrete form work, structural panels and sheathing for houses. Because it is obtainable in the large sizes it assists in expediting the construction of dwellings. Its smooth, unbroken surface makes it particularly suited for such purposes as linings for railroad cars, bus bodies, bins, boat sheathing, etc., and the ease with which it can be fabricated makes it the preferred material for a multitude of other applications.

As a result of wartime research curved plywood manufacture has become an increasingly important development in Canada's plywood industry. Curved plywood barrel staves are being manufactured and plywood house trim, moulded plywood boats, canoes, furniture and similar products have been developed and are being constantly improved. It has been found that the veneers of Canadian manufacture are well adapted to the many various applications of the plywood industry.

Exports of Canadian veneers and plywoods in the past ten years have risen from a value of \$682,743 in 1936 to a peak of \$18,498,881 in 1947.

Subsection 5.—The Wood-Using Industries*

Sawmills and pulp- and paper-mills draw their raw material directly from the forest in the form of logs and pulpwood, and produce sawn lumber, other sawmill products and pulp and paper. There are also a number of important industries that use these products as raw material for further manufacture. Some of them produce commodities made almost entirely of wood or wood-pulp, some manufacture articles in which wood is the most important component, and others produce articles in which wood is necessary but forms only a small proportion of the value. There are, in addition, a number of industries that use wood indirectly in the manufacture of articles that do not contain wood as a component part. The first class includes the manufacture of sash, doors, other mill-work and planing-mill products: boxes, baskets, cooperage and other containers; canoes, boats and small vessels; kitchen, bakery and dairy woodenware; wooden pumps, piping, tanks and silos; spools, handles, dowels and turnery. The second class includes products where wood is the outstanding material used and includes furniture, vehicles and vehicle supplies, coffins and caskets, etc. The third class, where wood has a secondary importance, includes the manufacture of agricultural implements, railway rolling-stock, musical instruments, brooms and brushes, etc. The fourth class can be said to include practically every form of industrial activity, as few, if any, are entirely independent of the use of wood, directly or indirectly.

A classification based on the chief component material in the products of each manufacturing establishment is now largely used in compiling manufacturing statistics and for external trade purposes. In 1945, this group, comprising 2,575 establishments, gave employment to 50,949 persons and paid out \$68,276,967 in salaries and wages. The gross value of its products was \$229,737,695 and the net value \$109,396,119.

The importance of secondary industry in providing employment will be appreciated when it is noted that the number of employees in this wood-using group is greater than 50,000 as compared with pulp and paper with approximately 40,000 employees in 1945.

Subsection 6.—The Paper-Using Industries†

The paper-using industries are a stage removed from the wood-using industries in that they take paper—a secondary product—as their raw material and fabricate it into still more highly processed forms.

* Prepared by the Forest Products Laboratories, Dominion Forest Service, Department of Mines and Resources, Ottawa.

† Prepared by the Pulp and Paper Research Institute of Canada, Montreal, Que.

The paper-using industries are classified for census purposes into four groups:—

(1) Those comprising the largest and most important class are engaged in the printing of news, advertisements, coloured designs, illustrations, etc., on paper in the publication of newspapers, periodicals, advertising matter, books, etc., and comprise six closely related industries, namely: printing and bookbinding, lithographing, engraving, stereotyping and electrotyping, trade composition, and blue-printing.

(2) Another large group of industries use paper or paper board as a raw material for conversion into paper bags, boxes, envelopes, wallboard and other commodities.

(3) The roofing paper industry is engaged wholly or chiefly in the manufacture of asphalt shingles and siding, composition roll roofings, and tar and asphalt felts and sheathings.

(4) The miscellaneous paper goods industry is engaged wholly or chiefly in coating, treating, cutting and otherwise transforming paper and paper board for special purposes exclusive of paper boxes and bags and roofing paper.

In considering the use of paper in industry, cases frequently occur where the same sheet of paper passes from one group of industries to another. The finished product of the paper-mill becomes the raw material of the coating-mill where its surface is treated to make it suitable for lithography. It then becomes the raw material of the lithographing industry where its surface is covered with a decorative, coloured design. It next becomes the raw material of the paper-box manufacturer who uses it to cover an ornamental box which is used by still another industry in the distribution of confectionery.

Another important fact in connection with the use of paper as a raw material is that old or waste paper can be salvaged, repulped, treated if necessary, and used over and over again being mixed with new pulp in making certain classes of paper from good bond and writing papers to paper boards.

The growth of the paper-using industries in Canada has been greatly accelerated by the production of cheap paper and paper board made of wood-pulp and by the development of typesetting and typesetting machines and the rotary press for high-speed printing. In addition, the education of the people and the printing industry have marched hand in hand during the past half century in Canada. With the ability to read came the demand for increased production of printed matter which has stimulated the publishing business.

Composition roofing consisting of paper felt saturated with asphalt or tar and coated with a mineral surfacing is being increasingly used as a substitute for metal roofing, slates and wooden shingles.

The use of fibre wallboard as a building material especially for insulating purposes, and a paper felt saturated with asphalt as a mulch paper to retain soil moisture and inhibit weed growth when certain crops are grown, are recent developments.

In recent years the manufacture of containers and packages of various kinds has grown very rapidly since ways have been found of converting tough and cheap paper stocks into strongly made boxes which compete very favourably with the wooden crates and packing cases formerly used. Small attractive paper containers for use in retail trade are growing in favour with the purchasing public and constitute an important branch of the paper-using industries.

In 1945, the paper-using industries employed 20,823 persons and had a gross value of production of \$138,055,346.

Section 1.—History of the Fur Trade

A historical outline tracing the development of the fur trade is published at pp. 281-282 of the 1946 Year Book. See also list of Special Articles under Fur Trade at the front of this volume.

Section 2.—The Fur Industry

Subsection 1.—Wild Life

The fur resources of Canada are among its most valuable assets, and though, with the advance of settlement, trapping has moved farther and farther northward and the practice of fur farming has developed considerably, wild life still produces the greater portion of Canadian furs. Over an area of about 1,550,000 square miles, which is approximately 45 p.c. of the total land area of Canada, wild life is relatively more productive than agriculture and of the products of wild life, furs are the principal item and the principal support of the population of that area.

Many of the most valuable fur-bearing animals are subject to marked fluctuations in numbers. The periods of abundance and of scarcity recur with sufficient regularity to be called cycles and these cycles have an important bearing on the pelt take year by year.

The conservation of fur-bearers, which has marked the policy of Federal and provincial authorities to an increasing extent, has been made necessary by an increasing demand for furs coupled with decreasing supplies. The resulting substantial rise in prices also brought about a tendency to 'over-trapping', and it has been found necessary to control the 'take' by prohibition, close seasons and the enforcement of trapping regulations. However, in a country of such extent, where trappers, both White and Indian, are scattered over a vast wilderness, prohibition of capture of certain animals with the aim of conserving future catches is not always effective. Such furs become higher priced because of this scarcity and the temptation to violate protective measures is great.

One noteworthy reconstructive measure that appears to have had a very beneficial influence on the rehabilitation of certain fur-bearers, especially beaver and muskrat, is the organized development of marshlands where these animals are actively assisted to increase their numbers in their natural habitat.

All provinces to-day have their trapping regulations and license individual trappers. Some provinces register trap lines. The Saskatchewan Government has recently inaugurated a system whereby districts are assigned to individual licensed trappers. The licensee in his own interests will see to it that no poaching is carried on in his preserve.

Statistics of wild-life fur production are combined with the production of fur farms in Section 3, pp. 432-436.

Subsection 2.—Fur Farming*

In the early days of the fur trade, it was the practice in Canada for trappers to keep foxes alive until the fur was prime, and from this custom has arisen the modern fur-farming industry. The earliest authentic record of raising foxes in captivity comes from Prince Edward Island, where about 65 years ago a number of foxes were raised on a farm near Tignish. After 1890, a period of rising prices for furs encouraged fox-farming and the industry grew rapidly. The beauty of the fur of the silver fox and the consequent high prices realized from the sale of the pelts, caused attention to be directed chiefly to this breed, which is a colour phase of the common red fox established through selective breeding carried on by the pioneer fox farmers. While experiments were being carried on in Prince Edward Island, attempts at raising foxes in captivity were also being made in other provinces; the records show that foxes were successfully bred in Quebec in 1898, in Ontario in 1905 and in Nova Scotia in 1906. The profitableness of fur farming became widely known in 1910 when prices obtained for the first silver pelts at the auction in London, England, were published. An average of \$1,339 per pelt was received on the sale of 25, one alone bringing the sum of \$2,627. A boom followed but this collapsed in 1914 and it was some time before the industry regained stability. Fur farming is now carried on in all provinces of the Dominion and the number of farms, until the outbreak of war in 1939, showed a steady increase. An experimental fox ranch is operated by the Federal Government at Summerside, P.E.I., where problems of breeding, feeding, housing and general care are studied.

Although the fox was the first fur-bearing animal to be raised in captivity, many other kinds are now being bred—mink, raccoon, skunk, marten, fisher and rabbit. Mink are the most numerous and the most valuable of such farm-raised animals. From 1920 to 1939 there was a rapid expansion of fur farming in Canada and during that period there was a marked change in the type of furs that were most acceptable to the market. Black fox was popular 25 years ago. A few years later the highest prices were being paid for quarter and half silvers and during recent years the full silver and new types have been setting the upper price limit. The development of new colour phases in foxes and mink has proven to be an incentive to the fur-farming industry. New-type fox such as platinum, platinum-silver, pearl-platinum and white-marked are meeting a ready market as are the new-type mink including silver-sable, platinum, silverblu, snow-white and a number of other colour phases.

In recent years chinchilla farming has been increasing and an association, the National Chinchilla Breeders of Canada, has been formed. These fur-bearers are now registrable under Live Stock Registrations of the Federal Department of Agriculture.

Statistics of fur farming are given in Section 3.

Section 3.—Statistics of Fur Production*

Total Fur Production Statistics.—Early records of raw-fur production are confined to the decennial censuses, when account was taken of the numbers and values of pelts obtained by trappers. In 1920 the Dominion Bureau of Statistics commenced an annual survey of raw-fur production, basing its statistics on information supplied by the licensed fur traders. This survey was continued for some years.

* Revised in the Agricultural Division, Dominion Bureau of Statistics.

More recently, annual statements, based on royalties, export tax, etc., have been made available by the provincial game departments (except Prince Edward Island), and these statements are now used in the preparation of the statistics issued annually by the Bureau. In Prince Edward Island, the statistics are based on returns supplied directly to the Bureau by fur traders who deal in furs produced in the Province.

¹ Approximate.

Ontario leads the provinces in value of fur production, accounting for 26.6 p.c. of the total in the 1946-47 season. The numbers of pelts taken in both Alberta and Manitoba were higher than in Ontario, but in those provinces muskrat and squirrel, which are lower-priced furs, made up the major portion of the total while in Ontario the more valuable mink, beaver and fox pelts brought the total value to a much higher level.

2.—Pelts of Fur-Bearing Animals Produced, by Provinces, Years Ended June 30, 1946 and 1947

Canada.....	7,593,416	43,870,541	100.0	7,486,914	26,349,997	100.0

The average values of nearly all types of pelts showed marked decreases in the year ended June 30, 1947, from the previous year. Ermine dropped from \$2.97 to \$1.61, muskrat from \$3.26 to \$1.94, squirrel from 79 cents to 44 cents, red fox from \$6.74 to \$3.81, beaver from \$50.80 to \$29.46, white fox from \$22.83 to \$13.49, new-type fox from \$47.83 to \$28.62, standard silver fox from \$27.93 to \$17.21, marten from \$56.17 to \$32.45 and standard mink from \$29.03 to \$19.61. As a result of these decreases in average values, the total value of production declined from \$43,870,541 in 1945-46 to \$26,349,997 in 1946-47, though the number of pelts taken was only slightly smaller in the later year.

Fur-Farm Statistics.—The number of fur farms in Canada dropped considerably during the war years because of difficulties experienced in securing feed and necessary labour. Most of those going out of business were the smaller farms or farms operated as a side-line to general farming. On the other hand, the value of land and buildings in 1946 showed an increase of 55.6 p.c. over the 1939 figure and the value of fur-bearing animals on the farms an increase of 136.0 p.c.

Section 4.—Marketing and Foreign Trade

The first Canadian fur auction sale was held at Montreal in 1920 and since then that city has been the leading Canadian fur mart. To-day, auction sales are also held at Vancouver, B.C., Edmonton, Alta., Regina, Sask., and Winnipeg, Man., and at Regina the Saskatchewan Government maintains a Fur Marketing Service to assist the producers in that Province.

Grading.—In 1939 the Dominion Department of Agriculture introduced the grading of furs. One of the Department's main objectives in grading is to secure uniformity so that furs may be purchased by grade without the necessity of buyers from other countries personally examining the pelts. Grading offers many advantages to the producer as well as to the trade in general. It educates the rancher as to the proper value of his pelts, and creates an incentive to improve the quality of the product; it furnishes guidance in the planning of future matings, aids in raising the standard of quality of the entire crop of pelts and helps in advancing the level of prices for high-quality pelts.

Exports and Imports.—Prior to the Second World War Canada marketed her fur pelts mainly in the United Kingdom but, since that market was practically dormant during the war years, the fur trade was carried on for the most part with the United States. A definite revival of trade with the United Kingdom was shown in 1946 and 1947.

The Canadian fur trade, both exports and imports, is chiefly in undressed furs, the value of dressed and manufactured furs going out of Canada or coming in making up a comparatively small proportion of the total. A good part of the exports consists, of course, of those furs which Canada produces in greatest abundance, mink being the most valuable, followed by fox, beaver and muskrat. On the

other hand, such furs as Persian lamb, certain types of muskrat, rabbit and squirrel, opossum and raccoon, which are not produced to any extent in Canada, make up the major portion of the imports.

Exports and imports to and from the United States, the United Kingdom and all countries are given for the years 1944-47 in the Foreign Trade Chapter, Tables 13 and 14.

Section 1.—The Early Fisheries

Historical records show that European fishing vessels frequented the waters of Canada's Atlantic Coast 400 years and more ago, and the prolific grounds have been fished continuously ever since that time. When John Cabot reached the North American mainland at the close of the fifteenth century he found Basque fishing vessels off the coast. The Old World fishermen had even ventured up the St. Lawrence, as Jacques Cartier found when he went inland in 1534. To-day the fishing industry—on the Pacific Coast and in the inland provinces, as well as in the Atlantic area—is an enterprise of great importance to Canada. According to the 1941 Census, 36,403 persons 14 years of age or over were gainfully occupied in the fishing industry on full time. Many others, of course, were engaged in the fishing industry on a part-time basis.

More detailed reference to the history of the fisheries of the Atlantic Coast will be found in the 1934-35 Year Book, p. 348.

Section 2.—The Canadian Fishing Grounds

Canada's fishing grounds fall naturally into three main divisions, Atlantic, freshwater or inland, and Pacific, and are among the most extensive and prolific in the world. A description of each, the fish obtained and methods of fishing, may be found on pp. 222-225 of the 1932 Year Book.

Section 3.—Governments and the Fisheries

Subsection 1.—The Federal Government*

The right of fisheries regulations for all parts of Canada rests with the Federal Government (Fisheries Act, 22-23 Geo. V, c. 42) but fisheries administration is carried out by either Federal or Provincial authorities, depending upon the area. In general, the Federal Government administers the tidal or sea fisheries and the Provincial Governments administer the fisheries in the non-tidal waters within their respective boundaries, but there are certain exceptions to this rule. In Quebec, by agreement between the Provincial and Federal Governments, all fisheries, both sea and freshwater, are under provincial administration. Again, the Federal Government administers the non-tidal fisheries of Nova Scotia as well as the fisheries of Yukon and the Northwest Territories. Some protective work in connection with non-tidal fisheries is carried on by the Federal Government in British Columbia, Prince Edward Island and New Brunswick.

* Revised by the Department of Fisheries, Ottawa.

Revenue received by the Federal Government from the fisheries in the year ended Mar. 31, 1947, amounted to \$973,160 as compared with \$1,109,484 in the preceding year. Expenditures in connection with the fisheries in 1946-47 were \$3,700,019, as compared with \$3,374,102 in 1945-46. Included in these expenditures were outlays in connection with the International Pacific Salmon Fisheries Commission and the International Fisheries Commission, or Pacific Halibut Commission, as well as the costs of departmental administration, etc.

Conservation.—A prime objective of the Federal fisheries authorities, ever since Confederation, has been intelligent conservation of the country's fisheries resources. Such moves as control of fishing seasons, the regulation of fishing operations including control of types of gear, the imposition of catch limitations where found desirable, the prevention of obstruction or pollution of fishing waters, and the prohibition of the capture of undersized fish, have been taken to achieve this objective.

In addition to the effort to maintain and increase fish abundance, the Department of Fisheries has carried on for many years a program of fish culture in various areas where fisheries administration is a Federal responsibility. In 1946-47 the Fish Culture Branch operated 13 hatcheries, 6 rearing stations, 6 salmon retaining ponds, and several egg-collecting stations, at a cost of \$221,580. During the year, almost 23,500,000 trout and salmon fry and fingerlings, plus some older fish, were transferred from the fish-culture establishments to suitable waters.

The Department's program for the development of "farms" for the commercial rearing of oysters in Atlantic regions where oyster areas are under Federal jurisdiction has shown substantial progress despite a slowing down during the war years. The program was begun in Prince Edward Island some years ago and has been carried on successfully there, in Nova Scotia and in some parts of New Brunswick. Oyster farming takes place on grounds made available to lessees by the Department on prescribed conditions. The methods of operation followed by the lessees are those advised by the Fisheries Research Board. In British Columbia and most of New Brunswick, the oyster areas are under Provincial jurisdiction.

Direct Assistance to Fishermen.—The Department makes available to fishermen and fish producers instruction and advice as to the most efficient methods of fish handling and processing. This is done with the co-operation of the Fisheries Research Board. The fisheries inspectors employed by the Department on the two coasts are qualified by courses of training to advise fishermen as to the best handling and processing methods. Special departmental officers, working in appropriate districts, also give expert instruction, orally or by operational demonstrations, as to certain processing methods. In addition, information obtained by the Research Board through studies and experiments at its six permanent stations, or research centres, is put freely at the disposal of the fishing industry. The Department arranges for adult-education specialists from St. Francis Xavier University, Antigonish, N.S., the Social Economic Service, Ste. Anne-de-la-Pocatière, Que., and the University of British Columbia, Vancouver, B.C., to assist fishermen in studying their problems and devising plans for meeting those problems through joint action. The cost of this special educational work is met by the Department.

A lecture-demonstration program on the nutritive values of Canadian fish foods and the best methods of preparing them for meals is carried on in different

parts of the country by the Department through qualified home economists. This program which has been in progress for some years is designed to assist in increasing the demand for fishery products.

For the benefit of the fisherman, weather reports and forecasts, prepared by the Dominion Meteorological Service, are broadcast several times daily from stations of the Canadian Broadcasting Corporation which cover the fishing areas concerned. The reports are also available to other stations for broadcasting.

During the War when special food demands had to be met by increased fisheries production, financial assistance toward the construction of additional fishing vessels of certain types was given by the Department of Fisheries. Under this plan, 20 vessels of the packer-seiner type were built on the Pacific Coast and about 15 draggers were constructed on the Atlantic Coast. Since the War 10 or 15 additional draggers have been constructed under a continuation of the assistance plan in the Atlantic area.

Fishing Bounty.—A bounty established by legislation and representing interest on the Halifax Award, is paid annually to fishermen and owners of fishing boats and vessels on the Atlantic Coast to assist in sea-fisheries development and construction of fishing vessels and boats (45 Vict., c. 18, 1882, and 54-55 Vict., c. 42, 1891).

¹ Includes payments to owners of vessels and boats.

Scientific Research.—On the scientific side the Department is serviced by the Fisheries Research Board of Canada which operates under the control of the Minister of Fisheries. The Board has six permanent fisheries research stations—two on the Pacific Coast, three on the Atlantic Coast, and one at Winnipeg—and one or two sub-stations. The station at Winnipeg is concerned entirely with fresh-water studies. Fisheries scientists and technicians carry on at these stations, or from these stations as bases, year-round investigations and experiments in connection with problems of the Canadian fisheries. Some of the stations are concerned with biological studies and others with investigations and experiments relating to fish handling and fish processing. Reference to fisheries research will be found in a special article on scientific and industrial research which appears at pp. 998-1001 of the 1940 Year Book.

International Problems.—Since 1933, under the *modus vivendi* which grew out of the unratified treaty of 1888, United States fishing vessels have been permitted entry to Canadian Atlantic ports to purchase bait and other supplies. From time to time in the past, the problem regarding United States privileges in

connection with fisheries in Canadian Atlantic waters has been of considerable importance and an outline of this problem will be found at pp. 351-352 of the 1934-35 Year Book. Port privileges have also been extended on the Pacific Coast to United States halibut fishing vessels for some years past and, more recently, to United States vessels fishing for black cod and several other species. Canadian fishing vessels have been granted similar privileges in United States ports on the Pacific Coast. The privileges include permission to tranship catches, buy bait, ship crews, etc.

In the Great Lakes regions where international questions relating to the fisheries are complicated by the existence of Provincial and State Government authorities as well as the Federal authorities of Canada and the United States, the two countries have signed an agreement to provide for the development, protection and conservation of the Great Lakes fisheries through joint action. This Convention, signed in Washington, D.C., on Apr. 2, 1946, following a study of Great Lakes fisheries matters by a board representative of Canada and the United States, provided for the establishment and maintenance by the two Governments of a Joint Commission which "shall undertake to develop a comprehensive plan for the effective management of the fisheries resources of the Great Lakes for the purpose of securing a maximum use of these resources consistent with their perpetuation". The term "Great Lakes" is defined as including Lake Ontario, Lake Erie, Lake St. Clair, Lake Huron, Lake Michigan, Lake Superior, and the connecting waters, bays and component parts of each lake, and also the St. Lawrence River from Lake Ontario to the 45th parallel of latitude.

On the Pacific Coast, preservation of the halibut fishery and the restoration to its former proportions of the sockeye salmon fishery of the Fraser River system, through joint action by Canada and the United States, have been undertakings of prime importance in comparatively recent years. The halibut fishery is dealt with by the International Fisheries Commission, equally representative of both countries, and through its research and subsequent regulatory control the halibut stocks have been greatly increased. As a matter of fact the stocks have been more than doubled, in the principal fishing areas at least, since 1930 when the halibut resources of the North Pacific and Bering Sea were apparently nearing depletion.

The International Pacific Salmon Fisheries Commission, also equally representative of the two countries, has achieved a major object in its program for restoring the Fraser sockeye fishery. This was the conquest of conditions at Hell's Gate Canyon, a narrow gorge on the Fraser River in British Columbia through which the fish must pass to reach the spawning grounds. Large-scale fishways were cut through the rock on either side of the Canyon, following intensive scientific and engineering studies by Commission experts, and have been successful in enabling spawning salmon to make their way past Hell's Gate at water levels which had previously blocked ascent and had therefore kept down the size of the run by reducing reproduction. Several other fishways, smaller than those at Hell's Gate but nevertheless of considerable importance as aids in increasing the sockeye stocks, have also been constructed by the Commission or are planned.

Costs of each commission are shared equally by Canada and the United States. The Salmon Commission has its headquarters at New Westminster, B.C., and the Halibut Commission at Seattle, Wash., U.S.A.

FAO and Its Relation to Fisheries.—The term "Agriculture" in the United Nations Food and Agriculture Organization in its broadest sense includes the fisheries and forestry. The functions of the Organization as they concern the fisheries in particular are given at pp. 291-294 of the 1946 Year Book.

Subsection 2.—The Provincial Governments

A general outline of the work undertaken by the different Provincial Governments in connection with the administration of commercial and game fisheries, assistance to the industry, educational and research work, and conservation may be found at pp. 279-286 of the 1945 Year Book.

Section 4.—The Modern Fishing Industry*

Subsection 1.—Primary Production

Expansion in the commercial fishing industry of Canada began in the latter half of the nineteenth century. In 1844 the estimated value of the catch was only \$125,000. By 1900 it had reached almost \$22,000,000 and the growth continued with little interruption until 1918, when it reached \$60,000,000. This figure was not again reached until 1941, owing largely to lower prices rather than to smaller catches, but in that year a new peak of \$62,258,997 was reached. Since that time, the value has increased progressively each year, reaching an all-time high of \$121,124,732 in 1946. This was an increase of \$7,253,632, or 6.4 p.c., over the previous record attained in 1945. The figures given represent the total value of fish as marketed, whether in a fresh, dried, canned or otherwise prepared state.

2.—Values of the Products of the Fisheries, 1870-1946

¹ Revised since the publication of the 1947 Year Book.
reported for the first time in 1945.

² Includes the Northwest Territories

The cod of the Atlantic and the salmon of the Pacific were rivals for first place in the earlier years of the fishing industry but since 1895 salmon has definitely been in first place with lobster second until the War reduced the foreign market. In 1946, cod, with an increase over 1945 of 12 p.c. in the quantity caught, took second place in order of marketed value; herring was third.

4.—Quantities of Sea and Inland Fish Landed, by Groups, 1929-46

¹ Includes Yukon for all years and the Northwest Territories for 1945 and 1946.

In Table 6 the quantities given are those of primary products caught, but the values are those of all products marketed, both primary and secondary. The grand totals are subdivided to show the values of the sea fisheries and inland fisheries, respectively, as compared with the whole. More detailed tables of quantities and values of both sea and inland fish marketed may be found in "Fisheries Statistics of Canada", published by the Dominion Bureau of Statistics.

6.—Quantities Caught and Values of All Products Marketed of the Chief Commercial Fishes, 1942-46

NOTE.—The catch as shown in this table is in each case exclusive of the quantity of livers landed, but the value includes the value of the livers landed.

¹ Includes cusk.

² Includes quahaugs.

³ Livers only were landed on the Pacific Coast.

⁴ Less than 0.1 p.c.

⁵ Totals include minor items not specified.

⁶ Since ling cod was included with cod for 1926, the average of the years 1927-30 was taken as the quantity of ling cod for 1926 and this was deducted from the quantity of cod reported for 1926, the resulting amount being used as the base for the volume index.

⁷ Indexes are not given in this case since no production was recorded for the base year.

The capital investment in the fisheries industry, represented by vessels, boats, nets, traps, piers and wharves, etc., used in the primary operations of catching and landing the fish, had a total value in 1946 of \$47,413,221 of which \$39,473,378 or 83 p.c. was credited to the sea fisheries. The number of men engaged in fishing during the year was 73,514; of this number 51,961 were employed in the sea fisheries and 21,553 in the inland fisheries, a gain of 3,963 for the sea fisheries and 1,840 for the inland fisheries over the previous year.

¹ Included with "boats". ² Revised since the publication of the 1947 Year Book. ³ These totals include all individuals employed in primary fishing operations irrespective of the period of employment. The census figures for 1941, given at p. 438, include only persons whose main occupation was fishing.

Subsection 2.—The Fish-Processing Industry

Of the 586 fish-processing establishments operating in Canada in 1946, only 30 were classified as salmon canneries. These canneries, however, accounted for \$28,312,559 or 28 p.c. of the total production, which amounted to \$100,124,371. Fish-processing establishments are classified according to the value of the principal product and it follows, therefore, that an establishment canning both salmon and herring might, in different years, be classified under either "salmon canneries" or "sardine and other fish canneries".

Much of the fish sold by the fish-processing industry is marketed in a fresh-frozen state. In 1946, about 38 p.c. of the product was so marketed, leaving 62 p.c. to be sold in the canned, cured or otherwise prepared state.

A special article on Developments in Fish Processing, prepared by the Deputy Minister of Fisheries, Ottawa, appears in the 1941 Year Book, pp. 225-226.

Subsection 1. Value and Volume of Production.....	456	SECTION 4. WORLD PRODUCTION OF METALLIC MINERALS AND FUELS.....	487
Subsection 2. Provincial Distribution of Mineral Production.....	463		

A short historical outline of the development of the mineral industry in Canada is given at pp. 309-310 of the 1939 Year Book and a special article on the Development of Canada's Mineral Resources in Relation to the War Effort, so far as that development had taken place by the middle of 1940, appears at pp. 289-309 of the 1940 edition. An article on the Outlook for the Mineral Industry in Relation to the Economic Development of Canada is given at pp. 302-314 of the 1946 edition.

Section 1.—Mining Laws and Government Controls

Subsection 1.—Mining Legislation

The mineral lands of Canada, like other Crown lands, are administered by either the Federal or the Provincial Governments. The Federal Government administers the mineral lands of Yukon and the Northwest Territories as well as those in Indian Reserves and in National Parks; all other mineral lands lying within the boundaries of the several provinces are administered by the respective Provincial Governments.

Mining Laws and Regulations on Dominion Lands.†—Dominion lands to which these regulations apply are those administered by the Lands and Development Services Branch, Department of Mines and Resources, and lie within Yukon and the Northwest Territories. Titles issued for Dominion lands, the property of the Federal Government, in these Territories reserve to the Crown the mines and minerals that may be found on or under such lands, together with the right of operation.

The Acts and regulations governing mining and quarrying on Dominion lands are: *Yukon and the Northwest Territories*—Coal Mining Regulations; Petroleum and Natural Gas Regulations (which provide that no person shall explore for petroleum or natural gas in Yukon or the Northwest Territories without first obtaining a permit to do so from the Minister of Mines and Resources); and Domestic Coal Permits. *Yukon*—Yukon Placer Mining Act (R.S.C., 1927, c. 216); Yukon Quartz Mining Act (R.S.C., 1927, c. 217); Dredging Regulations. *Northwest Territories*—Quartz Mining Regulations; Placer Mining Regulations; Dredging Regulations; Quarrying Regulations; and Permits to remove sand, stone and gravel from beds of rivers.

* Except where otherwise noted, this Chapter has been revised under the direction of W. H. Losee, Director, Census of Industry and Merchandising, Dominion Bureau of Statistics, by H. McLeod, Chief of the Mining, Metallurgical and Chemical Section.

† Revised by the Lands and Development Services Branch, Department of Mines and Resources, Ottawa.

Most of the regulations above mentioned have been amended recently and copies thereof and also copies of the Acts are available from the Lands and Development Services Branch of the Department of Mines and Resources, Ottawa.

Provincial Mining Laws and Regulations.*—The granting of land in any province, except Ontario, no longer carries with it mining rights upon or under such land. In Ontario, mineral rights are expressly reserved if they are not to be included. Some early grants in British Columbia, New Brunswick and Quebec also included certain mineral rights. Otherwise, mining rights must be separately obtained by lease or grant from the provincial authority administering the mining laws and regulations. Mining activities may be classified as placer, general minerals (usually metallic ores), fuel (coal, petroleum, gas) and quarrying. Under these divisions of the provincial mining industry, regulations may be summarized as follows:—

Placer.—In those provinces in which placer deposits occur there are regulations defining the size of placer holdings, the terms under which they may be acquired and held and the royalties to be paid.

General Minerals.—These are sometimes described as quartz, lode minerals or minerals in place. The most elaborate regulations apply in this division. In all provinces, except Alberta, a prospector's or miner's licence, valid for a year, must be obtained to search for mineral deposits. A claim of promising ground of a specified size may then be staked. This claim must be recorded within a time limit, with the payment of recording fees. Work to a specified value per annum must be performed upon the claim for a period up to five years, when a grant or lease of the mining rights may be obtained, subject to fees or annual rental. The taxation most frequently applied is a percentage of net profits of producing mines.

Fuels.—In those provinces in which coal occurs, the size of holdings is laid down and the conditions regarding work and rental under which they may be held. In some cases royalties are provided for. In the cases of petroleum and natural gas, a permit to drill on promising ground is usually first obtained. If oil or gas is discovered, the operator may obtain the lease or grant of a limited area subject to rental or fees. A royalty on production is sometimes payable.

Quarrying.—Regulations under this heading define the size of holding and the terms of lease or grant.

The legislation controlling mining and minerals in each province is given at pp. 278-279 of the 1942 Year Book. Copies of the legislation and regulations and details concerning them may be obtained from the following authorities:—

NOVA SCOTIA.—Minister of Mines, Parliament Buildings, Halifax.

NEW BRUNSWICK.—Department of Lands and Mines, Fredericton.

QUEBEC.—Minister of Mines, Quebec.

ONTARIO.—Department of Mines, Parliament Buildings, Toronto.

MANITOBA.—Director, Mines Branch, Department of Mines and Natural Resources, Winnipeg.

SASKATCHEWAN.—Department of Natural Resources and Industrial Development, Regina.

ALBERTA.—Department of Lands and Mines, Edmonton.

BRITISH COLUMBIA.—Department of Mines, Victoria.

* Compiled from material supplied by the Provincial Governments.

Subsection 2.—Government Controls

Control of Non-Ferrous Metals.*—The controls established to stimulate the production of non-ferrous metals, petroleum and coal during the war years 1939-45 were, by 1945, either dissolved or remained functions of supply distribution and prices taken over by the Wartime Prices and Trade Board (see 1947 Year Book, p. 441).

During the first six months of 1947 ceiling prices were increased on copper, lead, zinc, their alloys and scrap, and tin. In June, however, ceiling prices were removed from all non-ferrous metals with the exception of tin, its alloys and ingot metal containing tin, which, because of limited supply, remained under strict control.

The Dominion Coal Board.†—This Board was created in October, 1947 (11 Geo. VI, c. 57) to take over the powers, duties and functions of the Dominion Fuel Board that had systematically studied the fuel situation on behalf of the Government since 1922 (see 1947 Year Book, p. 441). The powers of the Dominion Coal Board are, however, much wider and its authority broader than those of the former Fuel Board. It has, for instance, wide emergency powers in regard to production and marketing and will administer the coal policy of the Government with the aim of securing a stable and prosperous industry with a minimum of public assistance.

Specifically the Board is charged with the responsibility of implementing the recommendations of the Royal Commission on Coal and the Act specifically states that it may undertake researches and investigations with respect to:—

- (a) the systems and methods of mining coal;
- (b) the problems and techniques of marketing and distributing coal;
- (c) the physical and chemical characteristics of coal produced in Canada with a view to developing new uses therefor;
- (d) the position of coal in relation to other forms of fuel or energy available for use in Canada;
- (e) the cost of production and distribution of coal and the accounting methods adopted or used by persons dealing in coal;
- (f) the co-ordination of the activities of Government Departments relating to coal; and
- (g) such other matters as the Minister may request or as the Board may deem necessary for carrying out any of the provisions or purposes of this Act.

The Board will also administer, in accordance with regulations of the Governor in Council, any subventions or subsidies relating to coal voted by Parliament. (See Chapter XX).

Wide powers are provided to deal with production and distribution and use of fuel in case of a national fuel emergency.

Subsection 3.—Estimates of Resources

The Coal Reserves of Canada.‡—A description of the coal deposits and coal resources of Canada appears in the 1946 Year Book, pp. 337-347. The classification of coals described and indicated on the legends of the accompanying maps in that

* From information supplied by L. H. Burleigh, Executive Assistant to the Administrator of Non-Ferrous Metals, Wartime Prices and Trade Board.

† Contributed by F. G. Neate, Executive Secretary, Dominion Coal Board, Ottawa.

‡ Prepared by B. R. MacKay, Geologist, Geological Survey, and published by permission of the Director, Mines and Geology Branch, Department of Mines and Resources, Ottawa.

article, is the uniform scientific classification of the coals of the North American Continent as a whole which was evolved and later adopted after almost ten years of united research by the Committee of the American Society of Testing Materials, and the Canadian Associate Committee on Coal Classification that was set up in 1928 by the National Research Council of Canada.

The adoption of this classification made possible for the first time an accurate comparison of the coal deposits of Canada with those of the United States as shown on the map of the Coal Fields in Canada and the United States that appears in the 1946 article. Prior to this investigation, coal deposits in these two countries having identical chemical and physical characteristics were being assigned to different groups and even to different classes.

The classification of coals by rank is based on the fact that different coals represent different stages in the process of metamorphism from the original vegetation through the series of peat, lignite, sub-bituminous, bituminous, and anthracite, and that each of these stages shows a different percentage of fixed carbon content and a different calorific value as calculated on the mineral-matter-free basis (ash free). The higher rank coals are classified according to the percentage of fixed carbon on a dry basis, whereas the lower rank coals, i.e., those containing less than 69 p.c. fixed carbon, are classified according to B.t.u. per pound on the moist (as mined) basis. The limits of the thirteen groups and the four main classes are indicated in the following statement.

CLASSIFICATION OF COALS BY RANK
(American Society of Testing Materials designation 1937)

Class	Group	Limits of Fixed Carbon or B.t.u. Mineral-Matter- Free Basis	Requisite Physical Properties
I—Anthracite ¹	1. Meta-Anthracite.... 2. Anthracite..... 3. Semi-anthracite....	Dry F.C. 98 p.c. or more. Dry F.C. 92 to 98 p.c. Dry F.C. 86 to 92 p.c.	Non-agglomerating.
II—Bituminous ²	1. Low Volatile..... 2. Medium Volatile.... 3. High Volatile A.... 4. High Volatile B.... 5. High Volatile C....	Dry F.C. 78 to 86 p.c. Dry F.C. 69 to 78 p.c. Dry F.C. less than 69 p.c. and moist ² B.t.u. 14,000 or more. Moist ² B.t.u. 13,000 to 14,000. Moist ² B.t.u. 11,000 to 13,000...	Either agglomerating or non-weathering. ³
III—Sub-bituminous....	1. A Coal..... 2. B. Coal..... 3. C ⁴ Coal.....	Moist ² B.t.u. 11,000 to 13,000... Moist ² B.t.u. 9,500 to 11,000. Moist ² B.t.u. 8,300 to 9,500.	Both weathering and agglomerating.
IV—Lignite.....	1. Lignite..... 2. Brown coal.....	Moist ² B.t.u. less than 8,300... Moist ² B.t.u. less than 8,300...	Consolidated. Unconsolidated.

¹ If coal is agglomerating it is classified in the Low Volatile Bituminous group. ² Moist B.t.u. refers to coal containing its natural bed-moisture, but not including visible water on the surface of the coal. ³ There may be coking and non-coking varieties in each group of bituminous coal. ⁴ Coals having 69 p.c. or more Fixed Carbon on a dry mineral-matter-free basis shall be classified according to Fixed Carbon regardless of B.t.u. ⁵ There are three varieties of coal in the High Volatile C Bituminous group, i.e., (1) agglomerating and non-weathering, (2) agglomerating and weathering, and (3) non-agglomerating and non-weathering.

Table 1 gives the most recent estimate of Canadian minable coal reserves, based on data compiled for the Report of the Royal Commission on Coal, 1946. The method by which the estimates are arrived at is described in the 1946 Year Book article at pp. 466-467 of the 1947 Year Book.

It will be noted that the estimated coal reserves are arranged in five different classes. The reason for this is that more than one rank of coal occurs in some of the deposits and the tonnages of some of these are so small or indefinite, due to the lack of chemical analysis, that it is difficult or impossible to separate the different ranks.

The reserves of each of these classes are calculated under the headings "Probable Reserves" and "Possible (Additional) Reserves". The Probable Reserves are those that have been calculated on considerable geological, drilling and mining development data, whereas the Possible (Additional) Reserves are those based on geological data of much more limited extent.

Preliminary Statement of the Quebec-Labrador Iron-Ore Resources.*—

Looking at this development in the perspective of time, the stages seem typical of many important mineral districts. The geological mapping of an early period has proved to be a valuable guide for prospecting, and the success achieved in a part of the field has encouraged research in the extensive favourable grounds indicated by the early exploration.

In 1895, Dr. A. P. Low, of the Geological Survey of Canada, reported, as a result of his explorations along canoe routes in the Labrador Peninsula, a belt of rocks, correlated with the Animikie Series of the Lake Superior Region, extending with a width of 40 miles and a length of over 350 miles northwesterly in the basins of the Hamilton and Koksoak Rivers. Along the southwestern part of this belt he found thick and extensive masses of iron formation. He gave descriptions, with analyses, of the siliceous iron ores that he encountered, and expressed the opinion that the iron ore of this region might become of economic importance.

The advent of the aeroplane made it possible, in this remote area of Quebec-Labrador, to prospect the iron-bearing rocks with the thoroughness required to discover the mineral deposits as now known. In 1929, Dr. J. E. Gill, having made observations from the air, made the first find of a high-grade hematite ore body, on a concession held by Weaver (Minerals) Ltd., at Ruth Lake in Labrador. This discovery was the incentive for subsequent prospecting for natural iron ore in this region.

In 1936, the Labrador Mining and Exploration Company, upon incorporation, acquired the Weaver concession, and in 1948 held from the Newfoundland Government about 19,000 square miles in the upper part of the Hamilton River Basin, Labrador. The Hollinger North Shore Mining Company, incorporated in 1942, held 3,900 square miles in an adjacent area to the north, in Quebec. In these areas, under the direction of Dr. J. A. Retty, Chief Geologist of these companies, intensive prospecting, geological mapping and reconnaissance programs were carried on during summer seasons since 1936. A number of rich hematite deposits, including the Goodwood, Ferriman, Burnt Creek and Ruth Lake, thousands of feet long and hundreds of feet wide, were revealed in a zone, about 50 miles long, crossing the Quebec-Labrador Boundary, and at Sawyer Lake some 40 miles farther to the southeast. In 1944, diamond drilling on the Sawyer Lake deposit penetrated

* Prepared by T. L. Tanton, Ph. D., Senior Geologist, Geological Survey of Canada, Department of Mines and Resources, Ottawa.

high grade iron ore to a depth of 220 feet. In 1946, drilling was commenced on the Ferriman and Ruth Lake deposits, and subsequently an extensive drilling program has been in progress and adits have been driven into the deposits. In March, 1948, it was reported that 41,000,000 tons of potential high-grade iron ore had been proved on the property of Labrador Mining and Exploration Company and 98,000,000 tons on the property of Hollinger North Shore Mining Company. The ore deposits under active investigation are so situated and of such a character as to admit of open-pit mining.

In 1947, transportation facilities into this area were improved by the construction of an air strip at Knob Lake, Que. Canada granted a charter to the Quebec North Shore and Labrador Railway Company permitting railway construction from the St. Lawrence River to the iron-bearing belt and along it to Ungava Bay. The distance from Seven Islands on the St. Lawrence to Ruth Lake is about 360 miles.

The iron-bearing belt, as mapped by Dr. Low, extends north-northwesterly beyond the Hollinger North Shore Exploration Company's concession in Quebec, for about 150 miles. Reports that have been made by companies with holdings in this area confirm the findings of Dr. Low, and indicate that the areas embrace ground that is geologically favourable for the occurrence of iron ore.

Section 2.—Summary of Mineral Production

The importance of mineral production as compared with other primary industries in Canada is indicated in Chapter XXVI while its part in the foreign trade of Canada is dealt with in Chapter XXI, Part II, especially Section 3, Subsections 2 and 3.

Subsection 1.—Value and Volume of Mineral Production

Historical Statistics.—Definite records of the annual value of mineral production go back to 1886 only, although actual production began with the earliest settlements. The figures given in Table 2 are not strictly comparable throughout the whole period, minor changes having been adopted in methods of computing both the metallic content of ores sold and the valuations of the products. Earlier methods resulted in a somewhat higher value than those now in use would have shown. However, the changes do not interfere with the general usefulness of the figures in showing the broad trends in the mineral industry.

2.—Value of Mineral Production, 1886-1947

Year	Total Value	Value per Capita	Year	Total Value	Value per Capita	Year	Total Value	Value per Capita

						1947 ²	619,133,429	49.21

¹ Beginning with 1931, exchange equalization on gold production is included.
revision.

² Subject to

Current Production.—Higher market prices for most metals and record outputs of fuels, structural materials and other non-metals brought the value of Canada's mineral production in 1947 to \$619,100,000, a gain of 23 p.c. over the corresponding total for 1946, and 9.2 p.c. over the former high figure established in 1942. Record output values were realized for the major base metals, although tonnages were, on the whole, considerably below those obtained in the war years. Also, the continuing demand for building materials and for asbestos, gypsum, barytes and other non-metallics enabled operators in these fields to reach new highs in tonnages as well as values.

In the past sixty years, Canada's mineral industries have recovered more than \$12,000,000,000 of new products with approximately 42 p.c. of this coming in the past decade. Annual figures are shown in Table 2. In 1886, the Dominion's mineral output was only \$10,200,000, but in 1900, four years after the discovery of gold in the Yukon, the value was up to \$64,400,000. With the development of silver properties at Cobalt after 1903, and with increased production of nickel and copper at Sudbury, the total value of output advanced steadily to \$106,800,000 in 1910. Then came the discovery of gold in the Porcupine district of Ontario, followed a few years later by those in Kirkland Lake, also a satisfactory method of treating the refractory ores of the great Sullivan mine in British Columbia, and these factors, along with higher prices because of the First World War, brought the value of mineral recoveries to \$227,900,000 in 1920. Severe price declines reduced the output value to \$184,300,000 in 1922, but in the following years there was steady improvement to \$310,900,000 in 1929. The Noranda smelter which treats of copper-gold ores came into production in 1927, the Flin Flon zinc smelter began operations in 1930, and the increase in the price of gold in 1931 encouraged the search for and development of new gold properties. By 1939 mineral output was up to \$474,600,000, and the all-out activities in the early years of the Second World War raised production in 1942 to \$566,800,000, a value which was not surpassed until 1947.

The value of metals in 1947 at \$389,500,000 was \$99,100,000 greater than in 1946. This was not quite up to the record total of \$395,300,000 in 1941, nor to the 1942 figure of \$392,200,000. Values for copper, lead, zinc and nickel were at all-time peaks, but these gains were more than offset by the level of gold production which was only about one-half of the 1942 figure.

Output of structural materials was greater than in any previous year, the 1947 value of \$72,700,000 being nearly 10 p.c. above the 1946 total. Shipments of cement, lime, brick and other clay products, stone and sand and gravel were, in each case, greater than ever before.

Value of fuels as a group, at \$105,200,000, was \$2,600,000 greater than in 1946. The tonnage of each was down, but the total value was increased substantially. The reverse was true for crude petroleum which was slightly higher in quantity but a bit lower in value.

Other non-metallics showed a substantial advance to \$51,700,000 from \$43,700,000 in 1946, the chief gain being in asbestos which increased from \$25,200,000 to \$31,800,000. Gypsum also showed a substantial increase.

Ontario's mines accounted for 39 p.c. of the Dominion's mineral output in 1947; British Columbia accounted for 18.2 p.c., and Quebec for 17.9 p.c. Alberta, Nova Scotia, Saskatchewan, Manitoba, New Brunswick, the Northwest Territories and Yukon followed in the order named. Output in Ontario increased by 26 p.c. over the 1946 total to \$241,700,000 in 1947; British Columbia gained 52 p.c. to \$113,100,000, and Quebec advanced 19 p.c. to \$110,600,000 in the same period.

MINERAL PRODUCTION, 1898-1947

(QUANTITY AND VALUE OF LEADING METALLICS)

PRODUCTION ——— VALUE - - - - -

In placing a value on Canada's mineral production, it has been customary to value the metals at average quotations (converted to Canadian funds) on the New York or the London markets, depending usually on the relative exports to these countries. In the war years, however, with the inauguration of price controls, it was necessary to depart from this practice, and during this period the average prices were supplied by the Canadian Metals Controller. In 1946, a weighted average was computed by applying the Canadian ceiling prices to the amounts sold for domestic use and the New York averages, in terms of Canadian dollars, to the quantities which were sold for export. A similar procedure was followed in 1947 during the period that price controls were in existence. The domestic ceiling prices on copper, lead and zinc were raised early in 1947 and ceilings were removed entirely about mid-year.

The steady rise in prices of the major base metals was the outstanding feature of the mining picture in the latter part of 1946 and throughout 1947. According to averages for Canada, on the basis indicated above, copper jumped from 12.7 cents per pound in 1946 to 20.3 cents in 1947, zinc from 7.8 cents to 11.2 cents per pound and lead from 6.7 cents to 13.7 cents per pound. Antimony rose from 15 cents per pound to 33.4 cents, bismuth from \$1.40 per pound to \$1.97, and cadmium from \$1.22 to \$1.72 per pound. In contrast, the price of gold to Canadian producers remained fixed throughout the year at \$35 per fine ounce. The average for silver dropped from 83.65 cents in 1946 to 72 cents in 1947.

¹ Value in Canadian funds. ² Not available. ³ Not available for publication. ⁴ Including brucite. ⁵ Includes some talc. ⁶ Sulphur content of pyrites shipped and estimated sulphur contained in the sulphuric acid made from smelter gases. ⁷ Includes relatively large quantities used in the manufacture of chemicals.

Analysis of Current Value and Volume.—In order to interpret more clearly and simply the trends in mineral production in Canada over the past ten years, Table 4 gives the percentage of the total value contributed by each principal mineral in each year. Values upon which percentages in this table are based are the annual values of mineral production expressed in Canadian currency as published in Tables 2 and 3.

4.—Percentages of the Total Value of Mineral Production, by Principal Minerals, 1937-46

¹ Less than one-tenth of one per cent.² Not available.³ Not available for publication.⁴ Includes minor items not specified.

Although the year 1926 was not a normal year in mineral production to the same extent as in some other productive fields, the rapid changes that have resulted from circumstances arising since then can be seen more clearly by using 1926 as a base year. Table 5 shows the indexes of volume of mineral production by principal minerals, for the years 1937-46. The very large increases in the production of petroleum and platinum metals are especially noteworthy.

5.—Indexes of Volume of Mineral Production, by Principal Minerals, 1937-46

(1926=100)

NOTE.—Indexes for 1927-36 will be found at p. 319 of the 1940 Year Book.

¹ Beginning with 1936, low-grade natural silica sand used as non-ferrous smelter flux is included.² 1928=100, previous years not being comparable.³ Excluding clay products.

Subsection 2.—Provincial Distribution of Mineral Production

Since 1907, Ontario has been the principal mineral-producing province of Canada. In 1940, Ontario accounted for 49.4 p.c. of Canada's total but its share has declined steadily to 39 p.c. in 1947. In the latter year, Ontario's principal metal, in point of value, was nickel which exceeded gold for the first time since 1920; copper was next, and these three leading metals accounted for 76 p.c. of total mineral production of the province. Higher prices for lead and zinc placed British Columbia above Quebec for the first time since 1937. A great part of Quebec's mineral production is made up of gold, copper and asbestos. Nova Scotia and Alberta are the most important coal-producing provinces. The discovery and development of the Flin Flon and Sherritt-Gordon ore bodies resulted in the Provinces of Manitoba and Saskatchewan becoming important producers of base metals, gold and silver. Alberta, besides being a big producer of coal, is the most important province for the production of petroleum and natural gas.

6.—Mineral Production, by Provinces, 1936-47

NOTE.—Figures for the years 1899-1910, inclusive, will be found at p. 345 of the 1933 Year Book; for 1911-28 at p. 323 of the 1939 edition; and for 1929-35 at p. 323 of the 1946 edition

¹ Subject to revision.

Table 7 shows the mineral production of each province in Canada in 1946.

7.—Detailed Mineral Production, by Provinces, 1946

NOTE.—Quantities and values of minerals produced during 1946 in Yukon were—gold, 45,286 fine oz., \$1,664,260; silver, 31,230 fine oz., \$26,124; lead, 52,144 lb., \$3,520; total \$1,693,904; and in the Northwest Territories—gold, 23,420 fine oz., \$860,685; silver, 6,112 fine oz., \$5,113; natural gas, 1,500 M cu. ft., \$335; petroleum 177,282 bbl., \$173,392; total \$1,039,525. Data for pitchblende products found in these areas are not available for publication. For the Dominion totals of individual minerals, see Table 3. Dashes in Table 7 indicate that no production was recorded. The ton referred to is the short ton of 2,000 lb.

Subsection 3.—Production of Metallic Minerals

The metals of chief importance in Canada are copper, gold, iron, lead, nickel, those of the platinum group, silver and zinc. These metals are dealt with individually in the following paragraphs. In addition, there are a number of metals produced in minor quantities, principally as by-products in the treatment of metalliferous ores (see Tables 3 and 7).

Copper.—Canada is a leading producer and exporter of copper, producing 450,587,079 lb. in 1947, including refined copper, and the copper content of concentrates and matte exported. The earliest important copper-mining district in Canada was in the Eastern Townships of Quebec, but the most important copper-bearing ore deposits are now located in northwestern Quebec, the Sudbury district in Ontario, the Flin Flon area in Manitoba and Saskatchewan, and in British Columbia. Production from the Sudbury district became important about 1889 and from the mines of British Columbia about 1896. From 1899 to 1929, British Columbia was the leading copper-producing province, production coming from the Rossland and Boundary districts, the Copper Mountain mine, and the Britannia and Hidden Creek mines along the coast. Shortly after the First World War, large development programs were carried out in connection with the Noranda, Waite-Amulet and other copper-producing properties in western Quebec, the Flin Flon and Sherritt-Gordon properties in western Manitoba, and a very large expansion program at the nickel-copper properties in the Sudbury area in Ontario. In 1947, the mines in Ontario accounted for 50·6 p.c. of the Dominion's copper production; Quebec was credited with 18·8 p.c.; Saskatchewan, 15·2 p.c.; Manitoba, 6·6 p.c. and British Columbia, 8·8 p.c.

A refinery at Montreal East, Que., treats anodes from the smelter at Noranda, Que., and also the blister copper recovered from Flin Flon ores at the smelter at Flin Flon, Man. The refinery at Copper Cliff, Ont., treats the blister copper from the smelter of the International Nickel Company of Canada, Limited, at Copper Cliff and also the blister from Sherritt-Gordon ores recovered at the Flin Flon reduction works. The Falconbridge Mines Limited, Falconbridge, Ont., regained possession of its refinery at Kristiansand, Norway, in May, 1945, and resumed shipments of matte to that point for treatment. The concentrates from mines in British Columbia are shipped to a United States smelter at Tacoma, U.S.A.

8.—Copper Produced, by Provinces, with Total Values, 1936-47

NOTE.—Figures for the years 1886-1910, inclusive, will be found at p. 272 of the 1916-17 Year Book; for the years 1911-28 at p. 335 of the 1939 edition; and for 1929-35 at p. 331 of the 1946 edition.

² Subject to revision.

As copper occurs in association with precious metals and with other base metals which are normally in heavy demand, it is likely that copper production will continue at a fairly uniform rate.

Gold.—Canada has been a gold-producing country for over seventy-five years. In the latter half of the nineteenth century production was chiefly from placer operations in British Columbia and Yukon; during the present century there has been a rapid growth of production from lode mining both of auriferous quartz and of gold in association with other metals. Gold production in Canada attained its earlier maximum at 1,350,057 fine oz., in 1900, when the Yukon production reached its highest point. The quantities and values of gold produced in Canada are given by provinces for 1936 and subsequent years in Tables 9 and 10.

Gold is produced in Nova Scotia, at points across the Canadian Shield from Quebec to the Northwest Territories, and in the Cordilleran Region of British Columbia and Yukon. Except for comparatively small amounts obtained from alluvial workings in Yukon, British Columbia, Saskatchewan and Alberta, gold production is derived from lode mining either of auriferous quartz or of other metallic ores such as copper, nickel and zinc that carry varying amounts of gold. The principal producing districts are: western Quebec; the adjacent districts of Porcupine and Kirkland Lake in Ontario, with other smaller camps scattered across northern Ontario to the western boundary; the Rice Lake and Gods Lake areas in eastern Manitoba and the Flin Flon district on the Manitoba-Saskatchewan boundary; the Bridge River district and the Zeballos camp in British Columbia. Developments in the Yellowknife district in the Northwest Territories have resulted in several producing mines. In 1947 the three leading gold producers in Canada were the Hollinger Mine, the McIntyre and the Dome mines, all in the Porcupine district. About 85 p.c. of the total production came from auriferous quartz mines; about 13 p.c. from mines in which gold was associated with ores of copper, nickel, zinc, etc.; and about 2 p.c. from alluvial operations. The auriferous quartz mining industry suffered severely from the shortage of labour and of essential supplies in the later war years; the number of producing mines decreased from 232 in 1939 to 88 in 1946 and their employees dropped from 29,001 to 17,889 during the same period.

9.—Quantities of Gold Produced, by Provinces, 1936-47

NOTE.—Figures for the years 1862-1910, inclusive, will be found at pp. 268-269 of the 1916-17 Year Book; for the years 1911-28 at p. 336 of the 1939 edition; and for 1929-35 at p. 332 of the 1946 edition.

² Subject to revision.

Iron.—Bog iron ore was first mined and smelted in the Province of Quebec early in the eighteenth century and from that time until 1883 the industry was carried on almost exclusively at Three Rivers. Other furnaces, using local ore, were operated at Radnor Forges and Drummondville, the last to shut down being the Drummondville furnace in 1911.

Deposits of iron ore in Canada are many and widespread, but because of the availability of low-cost, higher-grade ores in the Lake Superior ranges of the United States and the Wabana deposit in Newfoundland, no iron ore from domestic sources was produced in Canada from 1924 to 1939, inclusive.

In 1937 development work began at the New Helen mine of the Algoma Ore Properties Limited, in the Michipicoten area of Ontario and the first sinter was produced in July, 1939. The high-grade deposits being worked by the Steep Rock Iron Mines Limited, 135 miles west of Port Arthur, Ont., and the more recent discoveries of large deposits of iron ore in the Quebec-Labrador Boundary region have greatly raised the potentialities of Canada as a producer of iron ore. In 1947 there were 2,022,638 tons of iron ore produced, all of which came from Ontario.

11.—Iron-Ore Shipments and Production of Pig-Iron, Ferro-Alloys and Steel Ingots and Castings, 1936-47

NOTE.—Figures for the years 1886-1910, inclusive, will be found at p. 373 of the 1936 Year Book; for the years 1911-28 at p. 340 of the 1939 edition; and for 1929-35 at p. 333 of the 1946 edition.

¹ Subject to revision.

² Includes production of 1,788 short tons in British Columbia.

Lead.—Lead has been produced in Canada since 1887, and is obtained largely from the ores of British Columbia. Bounties were paid on lead produced in Canada from 1899 to 1918 but the highest production of this period was 63,169,821 lb. in 1900. However, the successful solving by the Consolidated Mining and Smelting Company of the metallurgical problems connected with the separation and reduction of these lead-zinc ores accounts to a considerable extent for the rapid growth in lead production after 1920.

In the East and West Kootenay districts of British Columbia there are many important mines, the principal of which is the Sullivan lead-zinc mine near Kimberley which accounts for about 90 p.c. of the total Canadian output. One of the world's largest smelters treats these ores at Trail, B.C. The lead-zinc mines in western Quebec account for most of the remainder of Canada's production, the concentrates from these properties being exported for treatment, chiefly to the United States. There was a small production in 1946 from the silver-lead-zinc ores in the Mayo district of Yukon and from northwestern Ontario. Production by provinces in 1946 is shown in Table 7, p. 464. Table 12 gives the total quantities and values of lead produced in Canada from 1936 to 1947.

12.—Quantities and Values of Lead Produced from Canadian Ores, 1936-47

NOTE.—Figures for the years 1887-1910, inclusive, will be found at p. 367 of the 1929 Year Book; for 1911-28 at p. 341 of the 1939 edition; and for 1929-35 at p. 333 of the 1946 edition.

Nickel.—The greater part of the world's output of nickel is produced in Canada and the source of all but a small percentage of the 235,561,113 lb. produced in 1947 came from the nickel-copper ores of the Sudbury district. Some nickel is also obtained as a by-product from the treatment of cobalt-silver ores. The nickel-copper industry includes the mining, smelting and, to a certain extent, the refining of nickel-copper ores. The ore is mined principally for the nickel-copper content, but silver, gold, selenium, tellurium and metals of the platinum group are profitably recovered in the metallurgical processes, although they are present in relatively small quantities. Smelting and copper refining operations are carried on by the International Nickel Company of Canada, Limited, at Copper Cliff, Ont., in close proximity to the mines, and refined nickel is produced at Port Colborne, Ont. The Falconbridge Mines Limited, has a smelter at Falconbridge, Ont., but the matte from this plant is shipped to Norway for refining. During the Second World War, Falconbridge matte was treated by the International Nickel Company at Copper Cliff, Ont. Recent discoveries of nickel-bearing ores in the Lynn Lake area in northern Manitoba appear to be quite promising.

13.—Quantities and Values of Nickel Produced, 1936-47

NOTE.—Figures for the years 1889-1910, inclusive, will be found at p. 363 of the 1929 Year Book; for 1911-28 at p. 342 of the 1939 edition; and for 1929-35 at p. 333 of the 1946 edition.

Metals of the Platinum Group.—This group of metals includes palladium, rhodium, ruthenium, osmium and iridium, with platinum and iridium as the most important. These metals occur in the nickel-copper ore of the Sudbury district and are recovered in the tank residues from the nickel refinery at Port Colborne, Ont.; the crude residues are sent to the refinery at Acton, England, for refining. The great increase in the output of nickel-copper ores has made Canada the leading producer of platinum since 1934, when it displaced Russia. The industrial uses of the platinum metals have expanded considerably in recent years, particularly in electrical and chemical equipment, jewellery and in medical and dental appliances. Canada produced 198,314 ounces of platinum metals for a total value of \$9,855,594, in 1947.

14.—Quantities and Values of Platinum and Palladium Produced, 1936-47

NOTE.—Records of the platinum production in Canada go back to 1887 but, prior to 1921, the amounts were comparatively small and the basis of calculation was not comparable with that now used. Figures for the years 1921-35 will be found at p. 340 of the 1940 Year Book.

¹ Includes also rhodium, ruthenium, osmium and iridium.

² Subject to revision.

Silver.—Silver mining is not a distinct industry in Canada as the silver-bearing minerals occur in association with other metals of economic value. Most of the metal is obtained from the treatment of base-metal ores although substantial amounts are recovered from gold-quartz ores and from alluvial gold deposits. For many years the famous camp at Cobalt, Ont., supplied the bulk of Canada's silver, but output from this area has been quite small in recent years. In 1947, 50.2 p.c. of Canada's silver came from British Columbia, 19.1 p.c. from Ontario, 17.9 p.c. from Quebec, 3.0 p.c. from Manitoba, 9.6 p.c. from Saskatchewan and 0.2 p.c. from Yukon and the Northwest Territories. Consumption of silver in Canada decreased substantially in 1947 and now amounts to about 4,500,000 fine oz. annually.

15.—Quantities and Values of Silver Produced, 1936-47

NOTE.—Figures for the years 1887-1910, inclusive, will be found at p. 361 of the 1933 Year Book; for the years 1911-28 at p. 344 of the 1939 edition; for 1929-35 at p. 334 of the 1946 edition.

Zinc.—Zinc production in Canada in 1947 showed a decrease of 11.9 p.c. from 1946. In the later year, British Columbia accounted for 60.7 p.c. of the total, Manitoba and Saskatchewan for 22.4 p.c. and Quebec for about 16.9 p.c.

The principal zinc-mining regions of British Columbia are situated in the Kootenay district, where there are large deposits of silver-lead-zinc ore. The chief producing mine is the Sullivan near Kimberley, while other mines are located in the Ainsworth and Slocan divisions of the West Kootenay district. The Britannia mine on Howe Sound, while primarily a copper-gold property, produces zinc concentrates when the market is favourable.

In northwestern Manitoba, the Flin Flon and Sherritt-Gordon mines have ores in which zinc is closely associated with copper and gold, and refined zinc has been made at the Hudson Bay Mining and Smelting Company's smelter from Flin Flon ores since the autumn of 1930. During 1947, zinc concentrates were shipped by the Waite-Amulet Mines, the Normetal Mining Corporation and the Golden Manitou Mines in the Rouyn district in Quebec, by the New Calumet mines, on Calumet Island, Que., near Renfrew, Ont., and by a number of mines in British Columbia. Production by provinces in 1946 is given in Table 7, p. 464.

Domestic requirements now take about 51,000 tons of refined zinc compared with 20,000 tons in pre-war years.

17.—Quantities and Values of Zinc Produced, 1936-47

NOTE.—Figures for the years 1911-28 are given at p. 347 of the 1939 Year Book; for 1929-35 at p. 335 of the 1946 edition.

² Subject to revision.

Subsection 4.—Production of Fuels

Coal Production.—The fuel situation in Canada is somewhat anomalous as, in spite of the enormous resources of coal and oil, output is relatively small in comparison with domestic requirements.

The Canadian coal areas are situated in the eastern and western provinces, while the areas of densest population and greatest industrial development, those of Ontario and Quebec, are more easily and economically supplied with coal from the nearer United States coalfields of Pennsylvania and Ohio. The coal produced in Nova Scotia, New Brunswick and British Columbia is all classed as bituminous, while Alberta produces semi-anthracite, bituminous, sub-bituminous and lignite, and Saskatchewan and Manitoba lignite only.

18.—Coal Production, by Provinces, 1936-47

NOTE.—Figures for the years 1874-1910, inclusive, will be found at p. 419 of the 1911 Year Book; for the years 1911-28 at p. 348 of the 1939 edition; and for 1929-35 at p. 347 of the 1946 edition.

Coal Consumption.—The sources of coal consumed in Canada in the calendar years 1936-47 are shown in Table 21 and detailed figures of coal made available for consumption in 1947 are given in Table 22; the difference between the totals of the two tables in the same year is accounted for by the fact that coal received may be held in bond at Canadian ports and not "cleared for consumption" until required, while coal received in previous years may be taken out of bond (cleared for consumption) in a later year. Normally, the coal made available for consumption is greater than the apparent domestic consumption, since coal is landed at Canadian ports and re-exported or ex-warehoused for ships' stores without being taken out of bond but, while remaining in bond at the port, it is available for domestic consumption if required.

19.—Imports of Anthracite, Bituminous and Lignite Coal into Canada, 1936-47

NOTE.—Anthracite dust is included under anthracite coal. Figures for the years 1888-1910, inclusive, will be found at p. 420 of the 1911 Year Book; for the years 1911-28 at p. 349 of the 1939 edition; and for 1929-35 at p. 348 of the 1946 edition.

¹ Coal reaching Canadian ports whether or not it is cleared from customs.

Petroleum.—A brief account of the development of the petroleum industry in Canada is given at pp. 266-267 of the 1941 Year Book. The development of oil production in the Northwest Territories is covered in the 1943-44 edition, pp. 316-317.

Demands for home production of oil in Canada in 1946, exceeded 60,000,000 bbl. and of this amount Canada produced over 7,000,000 bbl. Over 94 p.c. of this production was supplied by wells in the Province of Alberta, the remainder from the Provinces of Ontario, Saskatchewan and New Brunswick.

The remaining source of supply so far discovered in Canada is in the Northwest Territories where, during the War, 45 wells were pouring oil from that area through a 500-mile pipeline to Whitehorse from Norman Wells. This was an emergency venture and, with the end of hostilities, was abandoned as entirely uneconomic.

VALUES OF CRUDE PETROLEUM, BY PROVINCES, 1898-1947

MILLION
\$

The world problem of supply and demand in oil has become a major one. New fields are becoming harder to find and the steady production of the past years is declining. In view of these facts the encouraging developments on newly proven acreages of oil production in Alberta during the past few years have been of great importance and, for Canada, an incentive to greater possible production.

The quantity of crude petroleum produced in 1947 was slightly less than in the previous year.

¹ These figures are compiled on a somewhat different basis from the figure of the Alberta Government given on p. 477.

² Includes 331 bbl. at \$256 produced in Saskatchewan in 1940; 14,374 bbl. at \$15,362 in 1945; 118,686 bbl. at \$135,990 in 1946 and 528,932 bbl. at \$602,982 in 1947.

³ Subject to revision.

*The Alberta Oil Fields.**—The principal source of oil production in Alberta is in the Turner Valley. This field, although now 33 years old, accounted for 97,134,674 bbl. of oil from 1914 to Dec. 31, 1947, or over 90 p.c. of the total oil production of the Province. Production in this field has shown a steady decline, however, since 1942 although, due to newly discovered fields, the over-all Alberta production figures are again increasing.

There are at present 278 producing wells in this area and total production in 1947 amounted to 5,449,575 bbl.

Fields outside Turner Valley have continued to show noticeable increases. The Conrad and Taber fields were among the major producers during 1946 with production of 212,645 and 206,925 bbl. The Lloydminster field, however, became the centre of interest during the latter part of the year and, next to Leduc (see p. 477), is the most interesting area under development. This field, lying partly in Alberta and partly in Saskatchewan, showed the encouraging increase of from 23 wells producing 76,187 bbl. in 1946 to 46 wells with a production of 304,236 bbl. in 1947, from the Alberta side.

Early in 1947, when a shortage of oil supplies became generally noticeable, a new major producing field was discovered about 10 miles from the town of Leduc or about 20 miles south-west of Edmonton, Alta. This area, known as the Leduc field, came into production on Feb. 13, 1947, and No. 1 well was pronounced the largest producer of any field except Turner Valley.

* Statements taken from "1948 Alberta Oil Review" by A. C. Ballantine, Supervisor of Technical Publications, Government of Alberta.

Toward the close of the year, 30 wells in this area were producing daily 3,500 bbl. of oil of excellent quality, free of sulphur and with lubricant content. The oil is being carried from the field by pipeline to railhead at Nisku, about 8 miles east of the field. The Leduc field is developing in a most promising way and offers to be the greatest Canadian oil discovery since Turner Valley.

The following table gives production by fields, in 1947.

24.—Production of Alberta Oil Fields, 1947

NOTE.—Figures for total production of petroleum for the years 1922-46, are given at p. 473 of the 1947 Year Book.

The Tar Sands and Bituminous Developments.—Alberta, in its bituminous sands deposit at McMurray, has the greatest known oil reserve on the face of the earth. Estimates vary between that of Canadian geologists at 100,000,000,000 tons and that of the United States Bureau of Mines at 250,000,000,000 tons. The yield at present is about one barrel of oil per ton of sands.

At Bitumount, 50 miles north of McMurray on the Athabaska River, an Oil Sands, Limited, plant has been erected and experimentation regarding processing of the sand in that area is being carried out. Overburden covering the outcrop is very light at Bitumount and the product, being soft, lends itself more readily to separation than the harder outcrop in other parts of the reserve.

Another feature of the Bitumount area is the question of usage of the separated sand for glass manufacture. The sand analysed for such purpose has been favourably reported on, and quantities have been transported to points of manufacture.

A rich deposit of 'liquid bitumen' has been uncovered by Federal Government geologists on the west side of the Mildred-Ruth Lakes area, opposite the mouth of Steepbank River, 20 miles north of Fort McMurray in northeastern Alberta. The estimate of bitumen content per acre ranges as high as 350,000 bbl. The deposit is located within 20 miles of the north terminus of the Northern Alberta Railway at Waterways, and is about 250 miles north and east of Edmonton.

Within the area of best-grade material in the deposit, the 18 holes assayed thus far give a good indication of the quality and size of the deposit and, while they are quite insufficient for any precise estimates, the presence of a deposit large enough to warrant consideration of commercial development is indicated.

Natural Gas.—The producing natural gas wells in Eastern Canada are in southwestern Ontario, and near Moncton, N.B. In Western Canada the principal producing fields are in Alberta and include the Turner Valley (about 35 miles southwest of Calgary), Medicine Hat, Viking (about 80 miles southeast of Edmonton), Redcliff, Foremost, Bow Island and Wetaskiwin. Wainwright, Alta., is supplied

with gas from the Maple Leaf Well in the Fabyan field. In 1947, Alberta was credited with 57 p.c. of total value and 85 p.c. of the total quantity of natural gas. Ontario produced over 41 p.c. of the value and over 14 p.c. of the total quantity.

25.—Quantities and Values of Natural Gas Produced, by Provinces, 1936-47

NOTE.—For the years 1892-1919, see the Annual Report on the Mineral Production of Canada, 1928, p. 188; for the years 1920-28 see p. 347 of the 1940 Canada Year Book; and for 1929-35, p. 350 of the 1946 edition.

Subsection 5.—Production of Non-Metallic Minerals (Excluding Fuels)

The most important minerals in this group are asbestos, gypsum and salt, but it also includes numerous other items such as feldspar, graphite, iron oxide, magnesitic dolomite, mica, nepheline syenite, peat moss, sulphur, silica brick, sodium sulphate, soapstone and talc.

Asbestos.—The asbestos produced in Canada is practically all of the chrysotile variety and comes entirely from the serpentinized rock in the Eastern Townships of Quebec. The value of the annual production of asbestos increased from less than \$24,700 in 1880 to \$25,240,562 in 1946 and \$31,847,135 in 1947. The Canadian deposits are the largest known in the world. The producing centres are Thetford mines, which has been producing since 1878, Black Lake, East Broughton, Vimy Ridge, Asbestos, and St. Remi de Tingwick in Quebec. The veins of chrysotile asbestos vary in width from one-quarter inch to one-half inch and occasionally fibre has been obtained several inches in length. The fibre is of good quality and well adapted to spinning.

The world's largest market is in the United States and Canada's proximity to this market is very advantageous to the asbestos industry in this country.

26.—Quantities and Values of Asbestos Produced, 1936-47

NOTE.—Figures for the years 1896-1910, inclusive, will be found at p. 424 of the 1911 Year Book; for the years 1911-28 at p. 354 of the 1939 edition; and for 1929-35 at p. 353 of the 1946 edition.

Gypsum.—The use of gypsum in the building trades has increased rapidly and Canada has extensive deposits of gypsum favourably situated for commercial developments. They are chiefly located in Hants, Inverness and Victoria counties, N.S.; Hillsborough, N.B.; Hagersville and Caledonia, Ont.; Gypsumville and Amaranth, Man.; and Falkland, B.C. The Hillsborough deposit of gypsum in New Brunswick is of very high grade. Gypsum is exported from Canada in crude form mainly to the United States for the manufacture of gypsum products. Canadian production of gypsum amounted to 2,390,157 tons in 1947.

27.—Gypsum Produced, by Provinces, 1936-47

NOTE.—Figures for the years 1926-35 are given at p. 321 of the 1943-44 Year Book.

Salt.—Salt is obtained from brine wells in the Provinces of Ontario, Manitoba and Alberta, while at Malagash, N.S., it is recovered by mining rock salt and by evaporation from brine. The centres of production in Ontario of the salt industry are in Amherstburg, Goderich, Sandwich and Windsor.

In Nova Scotia a new recovery plant near Amherst began operations in 1947; previously all the output in this Province was from the mine at Malagash. A new plant near Unity, Sask., will be in production early in 1948. The market for salt in Canada is steadily increasing. Domestic production is sold principally to the dairy, meat-curing and -canning industry, to fisheries, to highways and transport departments, to agriculturists for use as a soil sweetener, to the chemical industries, and as table salt. In 1947, Ontario produced 632,544 tons of salt, 86 p.c. of the Canadian total. About one-half of the Dominion's output is used in making caustic soda, soda ash and related chemicals.

28.—Salt Produced, by Provinces, 1936-47

Sulphur.—Sulphur production statistics given in Table 29 represent the quantity and value of sulphur contained in iron pyrites shipped plus the quantity and value of sulphur reclaimed for acid manufacture, etc., from smelter fumes. As thus defined, the commercial output of sulphur in Canada during 1947 totalled 196,780 short tons, valued at \$1,601,372 compared with 234,771 tons worth \$1,784,666 in 1946. Production in 1947 comprised 58,222 tons of sulphur in iron pyrites and 138,558 tons recovered from smelter gases. Output by provinces was: Quebec 48,722 tons valued at \$182,542; Ontario 15,958 tons at \$159,580; and British Columbia 132,100 tons valued at \$1,259,250.

Sulphur is used in Canada chiefly in the production of sulphite pulp, sulphuric acid and rayon. It is used also in the manufacture of explosives, rubber goods, insecticides, matches and in petroleum refining.

29.—Quantities and Values of Sulphur Produced, 1936-47

Subsection 6.—Production of Clay Products and Other Structural Materials

Clay Products and Other Structural Materials.—Production of clay products and structural materials is dependent upon the activity of the construction industry in Canada; output in 1947 reached a record value of \$72,716,159. This group includes cement, clay, and clay products (brick, drain tile, sewer pipe, etc.), lime, sand, gravel and stone. The cement industry in Canada began with the manufacture of hydraulic or natural rock cement. Production was probably first obtained at Hull, Que., between 1830 and 1840. The manufacture of Portland cement began about 1889 and the largest production is now in Quebec and Ontario, although there are active plants in Manitoba, Alberta, and British Columbia. Common clays, suitable for the production of building bricks and tile are found in all the provinces of Canada, although production is greatest in Ontario and Quebec which are the chief areas of population.

Stoneware clays are largely produced from the Eastend and Willows area in Saskatchewan and shipped to Medicine Hat, Alta., where, owing to the availability of cheap gas fuel, they are used extensively in the manufacture of stoneware, sewer pipe, pottery, tableware, etc. Stoneware clay also occurs near Shubenacadie and Musquodoboit in Nova Scotia, some of the Musquodoboit clay is used for pottery, but it has not been developed extensively for ceramic use. Two large plants and a few small plants manufacture fireclay refractories from domestic clay in British Columbia, Saskatchewan and Nova Scotia.

Important deposits of high-grade, plastic, white burning clays occur in northern Ontario, and clay deposits which yield a high-grade of china clay have been found

along the Fraser River in British Columbia, but china clay has been produced commercially only from the vicinity of St. Remi D'Amherst, Papineau County, Que., where mining operations were carried on prior to 1923.

Ball clays of high bond strength occur in the "White Mud" beds of southern Saskatchewan, but these have not been developed to any extent.

30.—Values of Clay Products and Other Structural Materials Produced, by Provinces, 1936-47

NOTE.—Figures for the years 1926-35 are given at p. 355 of the 1946 Year Book.

¹ 'Production' as used here means quantity and value of sales.

² The barrel of cement equals

350 lb. or 34 cwt.

Sand and Gravel.—Deposits of sand and gravel are numerous throughout eastern Canada, with the exception of Prince Edward Island where gravels are scarce. The local needs for these materials are usually supplied from the nearest deposits, as their cost to the consumer is governed largely by the length of the haul. This accounts for the large number of small pits and the small number of large plants. Every province, except New Brunswick and Prince Edward Island, produces natural bonded sand. By far the greatest part of production comes from the Niagara Peninsula, Ont.

Some grades of sand particularly suitable for certain industries demand a much higher price than ordinary sand. Commercial production of sand and gravel is greatest in Quebec and Ontario; these two provinces contributed 74 p.c. of the total quantity in 1947.

The greater part of the output of gravel and sand is used in road improvement, concrete works and railway ballast, and most of the commercial plants are equipped for producing crushed gravel, a product that can compete with crushed stone.

Stone.—The stone industry in Canada has two main divisions, stone quarrying and the stone products industry. The kind of stone quarried in Canada includes granite, limestone, marble, sandstone and slate. The products of these quarries yield high-grade structural and decorative materials and also supply requirements for chemical and other allied industries. The gross value of stone of all varieties produced in Canada, in 1947, totalled \$12,263,534 as compared with \$11,185,711 in 1946.

Section 3.—Industrial Statistics of Mines and Minerals— Capital, Labour, Wages, etc.

The scope of the annual statistics on mineral production published by the Dominion Bureau of Statistics includes a general review of the principal mineral industries, such as the copper-gold, silver-lead-zinc, and nickel-copper industries, as well as a section on metallurgical works. Additional data published at irregular intervals, include such features as capital employed, numbers of employees, wages and salaries paid and net value of sales.

The figures for "net income from sales" of industries given in Tables 34 and 35 are those reported by the operators and are, in each case, the settlements received for shipments by producers and the additional values obtained when the smelting of ores is completed in Canada. The totals indicate more nearly the actual returns to the different industries than do the values for the minerals in Table 3 of this Chapter where, in the case of copper, lead, zinc and silver, the values are computed by applying the average prices for the year in the principal metal markets to the total production from mines and smelters with no reduction for fuel, electricity and other supplies consumed in the production process. Some imported ores and concentrates are treated in Canadian non-ferrous smelting and refining works, especially in the production of aluminum where imported ore only is used and of cobalt which now comes mainly from African ores. The net sales of these plants include, therefore, the net value of the metals recovered from these imported ores and, to this extent, the net sales shown in Tables 34 and 35 include products of other than Canadian origin.

34.—Principal Statistics of the Mineral Industries, by Groups, 1942-46, and by Provinces, 1946

NOTE.—Figures for the years 1936-41 are given at pp. 453-454 of the 1947 Year Book.

A summary of the industrial statistics of the principal mineral industries operating in Canada in 1944, 1945 and 1946 is presented in Table 35. The difficulties imposed by the War in the way of labour shortages, lack of new equipment and essential supplies necessary for the mines, resulted in a steady drop in the gross value of production for the entire auriferous quartz mining industry. The gross value of recoverable metals, gold, silver, etc., in the quartz mining industry, which was \$179,000,000 in 1941 fell steadily to \$88,000,000 in 1946.

Section 4.—World Production of Metallic Minerals and Fuels

World production figures are available only for gold, silver, and certain fuels. Tables 36 and 37 give historical figures of world production of gold and silver. These figures are the official returns from foreign countries or in cases where complete data were lacking, estimates are included only for the countries shown in Table 38.

36.—Quantities and Values of World Production of Gold¹, 1934-45

(From the Annual Report of the Director of the United States Mint)

NOTE.—Figures for intervening years from 1900-25 are given at p. 335 of the 1946 Year Book and 1926-33 at p. 463 of the 1947 edition.

¹ Estimates not included for countries not reported in 1939 and subsequent years.

About 60 p.c. of the total gold production represented in Table 38 in 1945, was accounted for by the Union of South Africa; 13 p.c. by Canada; 5 p.c. by United States; and 3 p.c. by both Australia and Southern Rhodesia.

Silver production showed 43 p.c. of the total for Mexico, 21 p.c. United States, 9 p.c. Peru and between 8 and 9 p.c. for Canada in 1944 and 1945.

38.—Quantities and Values of the World Production of Gold and Silver, by Principal Countries, 1944 and 1945

¹ Average price per fine ounce at New York.

² Not available.

³ Totals include all countries reporting.

Coal.—The total estimated coal production of the world in 1938, the latest year for which complete figures are available, amounted to about 1,420,000,000 long tons, a decrease of 6 p.c. from the previous year.

Petroleum.*—Oil production for the world, in 1946, reached a total of 2,750,705,000 bbl., including the Union of Soviet Socialist Republics which was responsible for 164,000,000 bbl. in this period. The countries contributing the major part of this total were: United States, 1,733,939,000 bbl.; Venezuela, 388,486,000 bbl.; Near and Middle East, 256,164,000 bbl.; Mexico, 49,235,000 bbl.; and Roumania 31,206,000 bbl. The production of each of these areas, with the exception of Roumania, showed an increase over 1945.

The British Empire produces only about 2 p.c. of world production of petroleum. Table 39 shows Empire production for the years 1943 to 1946.

A general estimate of world oil production for 1947, with presently procurable figures, gives an average daily production of 8,231,299 bbl. or a grand total of 3,004,424,000 bbl. The United States, responsible for 61.78 p.c. of world production stood first in quantity of production. Venezuela held second place with 14.47 p.c. of the world total, followed by the Middle East with 10.11 p.c. and the Union of Soviet Socialist Republics which produced 5.73 p.c. of the world figure.

* Preliminary data supplied by J. L. Irwin, Supervisor of Publications, Government of Alberta.

Section 1.—Water Power

Canada, a country of many lakes and rivers, has been abundantly endowed by nature with great water-power resources which are well distributed from the Atlantic to Pacific Coasts. In most sections of the Dominion, adequate precipitation and favourable topography result in numerous rivers on which falls and rapids frequently occur and offer excellent opportunities for the development of hydraulic power; with the exception of the Prairies of the middle west, water power resources of importance are found in virtually every part of the country. In British Columbia, where precipitation is high, the rivers flowing down the Pacific slope of the Rocky Mountains offer many fine power sites. Alberta, although a Prairie Province, also has mountain streams from the Rockies as well as great reserves of undeveloped power on its large northern rivers. The great Canadian Shield of Precambrian rock, which forms an arc around Hudson Bay, covers part of the Northwest Territories and northern Saskatchewan as well as a large part of Manitoba, Ontario and Quebec; it is a rough, forest-covered, well-watered area characterized by innumerable lakes and fast-flowing rivers with many falls and rapids. The potential power of the Great Lakes—St. Lawrence River System forms part of the great resources of Ontario and Quebec upon which their status as the principal manufacturing provinces of Canada is built and which compensates in large part for the lack of indigenous coal. In the Maritimes, the precipitation is moderately heavy and the rivers, while not large, afford numerous possibilities for power developments of moderate size.

The development from year to year of the great water-power resources of the Dominion is a good index of the country's industrial growth and of the change in its economic life since the beginning of the present century. In 1900, prior to the inception of long-distance transmission of electricity, Canada's economy was based largely on agriculture and the total of hydraulic installations, mostly small mills, was only 173,000 h.p. With the successful solution of the problems of transmission of electrical energy for use in distant communities, the development of

* In this Chapter of the Year Book all information respecting power generation and utilization in Canada is co-ordinated; some sections, however, cannot be regarded as complete owing to the insufficiency of available data. Section 1 has been revised under the direction of W. B. Timm, C.B.E., Director, Mines, Forests and Scientific Services, Department of Mines and Resources, by V. Meek, Controller, Dominion Water and Power Bureau, and Sections 2, 3 and 4 (except as otherwise stated) by G. S. Wrong, Director, Transportation and Public Utilities Division, Dominion Bureau of Statistics.

large hydraulic projects became practicable and by 1910, the total installation had risen to 977,000 h.p. In ensuing decades, the growth in installed capacity, partly speeded by war demands, proceeded at an accelerated rate so that by 1920, the total was 2,515,000 h.p.; by 1930, 6,125,000 h.p.; by 1940, 8,584,000 h.p.; and by the end of 1947, installed capacity had reached 10,491,000 h.p. Among countries of the world, Canada is second only to the United States in total hydro-electric installed capacity.

The availability of large amounts of hydro-electric energy from the Dominion's water-power developments has so fostered the economic utilization of the natural products from land, mine and forest, that Canada has become highly industrialized and is now one of the more important manufacturing countries. Low-cost power from Canada's rivers is fundamental in meeting the enormous demands of its largest industry, pulp and paper manufacturing, which ranks as one of the world's great industrial enterprises; it also allows the economic mining, milling and refining of base and precious metals and facilitates their fabrication into a multitude of manufactured articles. The great hydro-electric undertakings, built to meet the domestic and industrial requirements of the country, were of incalculable value to Canada's participation in two world wars, particularly in the Second World War. Between 1939 and 1945, approximately 2,000,000 h.p. was added to the Dominion's water-power capacity, all of which was used for war production; great quantities of power were also diverted from normal to war purposes; this allowed Canada to produce materials and munitions of war on a very large scale proportionate to population.

From hydro-electric developments, ranging in size from a few hundred to more than one million horse-power, networks of transmission lines carry power not only to most urban centres of Canada but also in increasing degree to the rural areas of the country. The wide distribution of power facilitates the dispersion of industry so that manufacturing processes covering foods, textiles, forest products and many others are important consumers of hydro-electric energy.

This wide distribution of hydro-electric power has also benefited the residents of small towns and villages by making available the same conveniences of household electric appliances as those enjoyed in the large towns and cities; these services are being rapidly extended to rural communities.

On the commonly accepted basis of one horse-power being the equivalent in energy to the work of ten men, Canada's present hydro-electric installation furnishes energy equal to that of more than 100,000,000 workers constantly employed.

Subsection 1.—Development and Growth of Water Power

Although extensive utilization at present is being made of Canada's water-power resources, there are large reserves still available for development. The greater part of this undeveloped power lies in the more remote parts of the Dominion but many sites within economic transmission distance of existing centres of population, have not been exploited as yet and existing power reserves not too distant should be sufficient to meet the prospective demand for some years to come.

Table 1 presents a summary of the water-power resources of Canada according to the records of the Dominion Water and Power Bureau as of Dec. 31, 1947. In the case of developed power, the figures for 1946 are listed for comparative purposes.

1.—Available and Developed Water Power by Provinces, 1946 and 1947

Province or Territory	Available 24-Hour Power at 80 p.c. Efficiency December, 1947		Turbine Installation	
	At Ordinary Minimum Flow	At Ordinary Six-Month Flow	Dec. 31, 1946	Dec. 31, 1947
	h.p.	h.p.	h.p.	h.p.
Prince Edward Island.....	3,000	5,300	2,617	2,617
Nova Scotia.....	20,800	128,300	133,384	133,384
New Brunswick.....	68,600	169,100	133,347	133,347
Quebec.....	8,459,000	13,064,000	5,848,572	5,878,872
Ontario.....	5,407,200	7,261,400	2,679,740	2,749,740
Manitoba.....	3,309,000	5,344,500	446,825	458,825
Saskatchewan.....	542,000	1,082,000	90,835	90,835
Alberta.....	507,800	1,258,000	93,060	106,560
British Columbia.....	7,023,000	10,998,000	864,024	917,024
Yukon and Northwest Territories.....	382,500	813,500	19,719	19,719
Canada.....	25,722,900	40,124,100	10,312,123	10,490,923

The figures listed in the first and second columns of Table 1 represent 24-hour power and are based upon rapids, falls and power sites of which the actual drop, or the head possible of concentration, has been measured or at least carefully estimated. Many unrecorded rapids and falls of undetermined power capacity exist on rivers and streams from coast to coast (particularly in the less-explored northern districts); these will become available for tabulation only as more detailed survey work is completed. Also, unless definite studies have been carried out and the results made matters of record, no consideration has been given to the power concentrations that are feasible on rivers and streams of gradual gradient, where economic heads possibly may be created by the construction of power dams.

The third and fourth columns give the total capacity of the water wheels actually installed throughout the Dominion; these figures should not be placed in direct comparison with those in the first and second columns to deduce the percentage of the available water-power resources developed. At developed sites, the water-wheel installation throughout the Dominion averages 30 p.c. greater than the corresponding calculated maximum available power figures included in the second column and covering the same sites. The above figures, therefore, indicate that the *at present recorded water-power resources* of the Dominion will permit of a turbine installation of more than 52,000,000 h.p.; also, the turbine installation at Dec. 31, 1947, represents roughly only 20 p.c. of recorded water-power resources and the figures in the first and second columns, therefore, represent the *minimum water-power possibilities* of the Dominion.

The growth of installed turbine capacity from 1900 to 1947 is shown by the figures given in Table 2, covering decades to 1940 and years 1941 to 1947.

¹ Includes Yukon and the Northwest Territories. Turbine horse-power installed in Yukon for the decades 1900 to 1940 was, 5 h.p. in 1900, 3,195 h.p. in 1910, 13,199 h.p. in 1920 and 1930, and 18,199 h.p. in 1940; the removal of a 3,180-h.p. plant reduced the installation for 1943-47 to 15,019 h.p. In 1941, a 4,700-h.p. plant came into operation in the Northwest Territories.

Table 2 shows clearly the consistent growth in capacity since the beginning of the century; also the heavy increase in installation during the war years 1942 and 1943. The 1947 increase was moderate, but new installations at present under construction have a capacity in excess of 500,000 h.p.

Table 3 has been prepared to show under three classifications the purposes for which the developed water power is primarily utilized.

3.—Developed Water Power by Provinces and Industries, as at Dec. 31, 1947

Province or Territory	Turbine Installation			Total ⁴
	In Central Electric Stations ¹	In Pulp and Paper Mills ²	In Other Industries ³

Percentages of total installation.....	90.6	6.3	3.1	100.0

¹ Includes only hydro-electric stations that develop power for sale.

² Includes only water power

actually developed by pulp and paper companies.

³ Includes only water power actually developed by

industries other than central electric stations and the pulp and paper industries.

⁴ All water wheels

and hydraulic turbines installed in Canada.

It may be noted that central electric station classification totalling 9,503,404 h.p. represents more than 90 p.c. of the total developed water power as of Dec. 31, 1947. In 1900 the corresponding percentage was 33.5, thus showing the tremendous growth in the central electric station industry since the inception of successful long-distance transmission of electricity. Central electric stations produce 98 p.c. of all electricity sold in or exported from Canada.

The pulp and paper turbine installation total of 658,741 h.p. shown in Table 3 includes only water power *actually developed* and directly used by pulp and paper companies. In addition, this industry is the greatest purchaser of central station power, buying about 50 p.c. of all power sold for industrial purposes. Part of the purchased power is classed as secondary, being used for steam generation by electric boilers which have a capacity of more than 1,930,000 h.p. The motor installations for the use of primary purchased power aggregate approximately 1,480,000 h.p.

The "other industries" group of Table 3, column 3, develops a total of 328,778 h.p. solely for their own use. These diversified industries also provide a broad market for the power sold by the central electric stations.

The figure of total hydraulic installation in Canada, 10,490,923 h.p., is the cumulative total of installation for all water wheels and hydraulic turbines. It has been adjusted to Dec. 31, 1947, by the addition of any installations made during the year even though this equipment may not be in use; adjustments are also made covering turbines or water wheels that have been removed. Somewhat similar figures are reported by the annual Census of Industry: they differ slightly since they are compiled on a different basis and represent only the sum of the installations in the plants actually in operation during the year being reported by the Census, not total installation.

Additional information regarding Canada's water-power resources is included in the 1940 Canada Year Book, pp. 353-364. Comparison is made with the resources of other countries and an extensive review is given of problems connected with the development, distribution and merchandising of power in Canada.

Subsection 2.—Current Programs of Provincial Water-Power Developments*

During 1947, additions to the generating capacity of the country totalled 178,800 h.p., this was slightly more than one-half the normal rate of increase. Due to large additions made during war years, material and labour shortages, and to an anticipated drop in power consumption in the early post-war period, little construction was undertaken during 1945 and 1946. The great demand for electricity during 1946-47 caused marked activity by power-producing agencies and resulted in a huge program of hydro-electric construction and late in 1947, shortages of power, particularly in southern Ontario, required the imposition of restrictions on power use. Early in 1948, plants were under construction which will have a capacity of over 1,000,000 h.p. of which probably 500,000 h.p. will come into operation later in the year.

Maritime Provinces.†—In the Maritime Provinces, while no additions to hydro-electric capacity were made during 1947, two new developments were under active construction and scheduled for completion in 1948. The Nova Scotia Power Commission is making favourable progress on the Dickie Brook development

* Figures given in this subsection represent horse-power on turbine shaft; turbine capacity in electric horse-power is used in Subsection 2, pp. 502-514.

† In addition to the water-power developments described, the Canada Electric Company is adding 15,000-kw. capacity to its steam plant at Maccan, N.S. The New Brunswick Power Company completed the addition of 10,000-kw. capacity in its steam plant at Saint John in 1947 and the New Brunswick Electric Power Commission is building a new steam plant of 12,500-kw. at Chatham.

which will operate initially at 3,700 h.p. but ultimately will have three units of 1,600 h.p. each; the Commission is also building a new steam plant at Pictou, with a capacity of 10,000 kw. The Nova Scotia Light and Power Company is proceeding with a development of one unit of 4,600 h.p. on Methals Brook.

Quebec.—In Quebec, the Gatineau Power Company, in the spring of 1947, completed the installation of the fifth and final unit of 24,000 h.p. in its Farmers Rapids plant on the Gatineau River; the Lower St. Lawrence Power Company also completed the construction of its 6,000-h.p. plant on the lower Metis River and it was placed in operation in October. The Shawinigan Water and Power Company made favourable progress on the construction of its new development of 195,000 h.p. at Shawinigan Falls, St. Maurice River, and it is scheduled for operation in 1948; the Company is also planning a development of 350,000 h.p. at La Trenche Rapids on the St. Maurice. The Quebec Hydro-Electric Commission is adding a fourteenth unit of 50,000 h.p. in its Beauharnois plant No. 1 on the St. Lawrence River and is planning the construction of No. 2 power-house with a capacity of four units of 50,000 h.p. each; the Commission is also installing a fourth unit of 16,000 h.p. in the Ottawa River Rapid VII plant in conjunction with a storage dam on Lake Dozois. Successful stream flow control was achieved by the Quebec Streams Commission on the rivers it regulates by the operation of its extensive system of storage dams.

Ontario.—The Hydro-Electric Power Commission of Ontario during 1947, completed the installation of a new unit of 70,000 h.p. in the DeCew Falls plant near St. Catharines. By the end of that year, the Commission also had two major and one smaller project under active construction with completion scheduled for 1948: the Stewartville development on the Madawaska River with a capacity of 81,000 h.p. in three units and the Aguasabon development, on the north shore of Lake Superior near Schreiber, rated at 53,500 h.p., were scheduled for operation in the autumn of 1948: a fourth unit of 7,500 h.p. was being added to the Ear Falls plant, English River, and was expected to be completed by May, 1949. On the Ottawa River, preliminary construction activities were well advanced on the Des Joachims development, initial plans calling for an installation of six units of 60,000 h.p. each, the first two to come into operation in 1950; the Chenaux Rapids site, which will have an ultimate capacity of 160,000 h.p., was in the earlier preliminary stages of construction in 1948 with initial operation also scheduled for 1950. In Northern Ontario, a beginning was made on two new major projects: Pine Portage site on the Nipigon River will have an initial capacity of 80,000 h.p. in two units and ultimately four units; the Tunnel site on the Mississagi River, about 19 miles from Thessalon, will have two units of 29,000 h.p. each.

*The Prairie Provinces.**—In Manitoba, the city of Winnipeg brought into operation the seventh unit of 12,000 h.p. in its Slave Falls power-house, Winnipeg River during 1947; the eighth and final unit under installation in 1948 is now

* In addition to the water-power developments described the Saskatchewan Power Commission in January, 1947, brought into operation a new steam turbo-generator of 15,000-kw. at Saskatoon.

in operation. The Winnipeg Electric Company has work in progress in regard to raising the head at its Seven Sisters plant, Winnipeg River, to the final limit of 66 ft. and the installation of a fourth unit of 37,500 h.p.; the present plant has three units rated at 20,000 h.p. under partial head but the ultimate capacity is six units of 37,500 h.p. each.

In Alberta, the Calgary Power Limited, completed its Barrier Development on the Kananaskis River and brought into operation its 13,500-h.p. single unit. In northern Saskatchewan, the Churchill River Power Company is proceeding with the installation of a sixth unit of 21,000 h.p. in the Island Falls plant, Churchill River.

British Columbia.—In 1947, British Columbia added 53,000 h.p. to the total hydraulic installation of the Province. The British Columbia Power Commission brought into operation the first unit of 28,000 h.p. in its new plant on the Campbell River, Vancouver Island, and construction is proceeding on a second similar unit. The Powell River Company completed the raising of the Scanlon Dam on the Lois River and installed a second generating unit of 25,000 h.p. in its Stillwater powerhouse. The British Columbia Electric Railway Company made good progress on its Bridge River plant, the first unit of 62,000 h.p. being expected to come into operation in the autumn of 1948. The city of Nelson is installing an additional unit of 6,750 h.p. in its plant on the Kootenay River.

The Northwest Territories.—In the Northwest Territories, favourable progress was made during 1947 on the construction of an 8,000-h.p. development on the Snare River about 90 miles northwest of the town of Yellowknife. This project has been undertaken as a Federal Government enterprise by the Department of Mines and Resources to assist and encourage development in the Yellowknife mining district, power to be supplied at cost to mines and other consumers in the area.

Section 2.—The Central Electric Station Industry

An article dealing with Government control of power in wartime is given at pp. 336-337 of the 1945 Canada Year Book.

Summary of Energy Generated by Type of Station, 1945 and 1946.—

Central electric stations are companies, municipalities or individuals selling or distributing electric energy, whether generated by themselves or purchased for resale. Stations are divided into two classes according to ownership, viz., (1) commercial—those privately owned and operated by companies or individuals, and (2) municipal—those owned and operated by municipalities or Provincial Governments. These are subdivided according to the kind of power used into (a) hydraulic, (b) fuel, and (c) non-generating. This last sub-class purchases practically all the power it resells; a few of these stations have generating equipment that is held for emergencies. The hydraulic stations contain water turbines and wheels with approximately 88 p.c. of the total capacity of hydraulic installations in all industries in Canada and the generators driven by this hydraulic equipment generate 98 p.c. of the total output of all central electric stations.

4.—Electric Energy Generated, by Type of Station, 1930-44, and by Provinces, 1945 and 1946

Subsection 1.—Statistics of Central Electric Stations

The growth of the central electric stations industry has been almost continuous since 1919, when statistics of kilowatt hours generated were first made available. The depression that occurred in the early 1930's resulted in decreased output of power for several years but output soon recovered. During the war years 1939-44 the equipment was used to the practical maximum capacity, the output increasing by 42 p.c. from 1938 to 1944. The output declined slightly in 1945 but rebounded in 1946 to 102 p.c. of the 1944 figure. During 1947 a new record was established.

The central electric stations industry is one that is particularly suited to large-scale operations because of the huge outlays of capital necessary. Capital invested and total horse-power installed increased almost continuously even during the depression years, mainly because large power projects, planned before the depression, were in process of construction. Off-peak and surplus power, used mainly in electric boilers of pulp and paper plants, grew steadily to a peak of 7,803,000,000 kwh. in 1937 but, owing to war requirements for firm power, it was reduced during 1940-45, but rebounded to a new high of 8,067,489,000 kwh. in 1946.

5.—Summary Statistics of Central Electric Stations, 1931-46

NOTE.—Figures for the years 1917-30 will be found at p. 369 of the 1940 Year Book.

¹ Excluding duplications.² Not including auxiliary-plant equipment.³ Not collected.

Although the amount of power used by domestic customers or for residential purposes is now only 9.3 p.c. of the total production of central electric stations, this service is exceedingly important. Details of the number of domestic customers served, the kilowatt hours delivered and the costs to the customers, exclusive of direct Federal, provincial and municipal taxes on such service, are shown in Table 6. The average consumption per customer and average cost per kilowatt hour vary considerably as between municipalities and also as between provinces; there are smaller differences between the average bills.

Equipment of Central Electric Stations.—Auxiliary equipment includes only thermal engines and generators operated by them in hydraulic stations and in non-generating plants and does not include spare equipment in thermal stations or

spare hydraulic equipment in hydraulic stations. Such equipment is classed as main-plant equipment. The capacities of the equipment are the manufacturers' ratings and, for water wheels and turbines the kilowatt hour capacities vary with the supply of water. The majority of the hydraulic stations are large, serving wide areas over transmission lines, whereas most of the plants with thermal engines are small, serving the needs of the local municipality.

7.—Main-Plant Equipment of Central Electric Stations, by Provinces, and Total Auxiliary Equipment, 1945

NOTE.—Kva. means kilo-volt-amperes.

Farm Service Furnished by Central Electric Stations.—Table 9 shows the number of farm customers, the average annual consumption, average annual revenue exclusive of the 8 p.c. Federal tax, and the average revenue per kilowatt hour sold to these customers in each province for 1946.

Effective Jan. 1, 1944, the Ontario Hydro-Electric Power Commission reclassified its rural customers, including under "farm customers" only farm contracts whereby one or more dwellings occupied by families engaged in the operation of the farm would be counted as one customer. This classification excluded other rural dwellings, stores, garages, repair shops, etc., also small properties of five acres or less except under special conditions. This change in classification explains the apparent decrease in farms served as shown in previous years. The Ontario Government pays for part of the cost of installing services to farm customers, which accounts in part for the lower average revenue per kilowatt hour in Ontario as compared with the other provinces.

Export and Import of Electric Power.—Electric energy is exported from Canada only under licence and an export tax of 0.03 cents per kilowatt hour is levied with some exceptions. The export duties for the fiscal years ended Mar. 31, 1944 to 1947 were \$641,253, \$639,320, \$694,518 and \$598,751, respectively.

Exports for the years 1944-47 are shown in Table 10. There are also large interprovincial movements of electric energy from Quebec to Ontario, and smaller movements from Quebec to New Brunswick and British Columbia to Alberta.

The water allowed to be diverted at Niagara Falls for power purposes was increased by 5,000 cu. ft. per second to the Canadian side in November, 1940, owing to a diversion of water from Long Lake and the Ogoki River from the James Bay watershed to the Great Lakes watershed. In 1941 a further increase of 9,000 c.f.s. to the Canadian plants and 12,500 c.f.s. to the United States plants was permitted, and in 1943 an additional 4,000 c.f.s. to Canadian plants bringing the totals up to 54,000 c.f.s. for Canada, and 32,500 c.f.s. for the United States. This increased water with greater development of plants on the St. Lawrence River made possible the increased export of both firm and secondary power to the United States (5,000 c.f.s. will produce around 150,000 h.p. at the Queenston, Ont., plant). During 1947, increased demands from consumers and low water reduced the surplus energy available for export.

Subsection 2.—Public Ownership of Central Electric Stations*

Water power is developed in Canada by provincial commissions, by municipalities and by private companies—hydro-electric plants. The first such provincial commission was formed in Ontario in 1906 to act as trustee for a group of municipalities to develop and distribute electricity. The Hydro-Electric Power Commission of Ontario now generates and purchases power, transmits it to rural and urban municipalities and serves large power customers. Similar commissions have been formed in each of the other provinces.

* The information included under the provincial headings of this Subsection has been revised by the various provincial commissions or authorities concerned.

A large portion of the power development in Quebec is connected with pulp and paper plants and with the aluminum industry. Such power plants are operated as separate organizations and deliver power to the parent companies at relatively low rates. Also, substantial blocks of power are produced in Quebec for export to Ontario.

Table 12 shows statistics of municipally or publicly owned central electric stations, by provinces, for 1946. Table 22 at p. 515 shows comparable statistics for commercial stations.

12.—Publicly Owned Central Electric Stations, by Provinces, 1946

Because of the absence of free market determination of prices and regulation of services in an industry that is semi-monopolistic, regulation of electrical utilities has been attempted in most provinces. The governing bodies of the provincial electric power commissions, their functions and activities are summarized by provinces below.

Nova Scotia.—In 1909 legislation was first enacted in Nova Scotia relating to the use of water power in "An Act for the Further Assisting of the Gold Mining Industry". This was the most advanced legislation until the development of water power within the Province of Nova Scotia was initiated under the Acts of 1914 and carried on in an investigatory manner in co-operation with the Federal Government until 1919, when the Nova Scotia Power Commission was created under the Power Commission Act. Certain investigatory work is still carried on in Nova Scotia by the Federal Government through the Dominion Water and Power Bureau with which the Nova Scotia Power Commission is closely associated. The control of the water resources of the Province is vested in the Crown and administered under the provisions of the Nova Scotia Water Act of 1919. The Commission pays the regular fees for water rights.

The function and policy of the Commission is the supply of electric power and energy by the most economical means available. The Rural Electrification Act of 1937 greatly increased the possibilities for retail service. It provides for financial assistance to equalize cost and revenue of extensions, the construction of which have been approved by the Governor in Council as qualifying under the Act. In 1941, an amendment to the Power Commission Act authorized the Commission, subject to the approval of the Governor in Council, to regulate and control the generation, transformation, transmission, distribution, supply and use of power in the Province.

Financially, the Commission is self-supporting, repaying borrowings from revenue. The balance sheet at Nov. 30, 1947, showed total fixed assets of \$20,483,549, including work in progress amounting to \$717,695. Current assets amounted to \$220,493. Liabilities are shown as follows: fixed \$14,599,533; current \$1,971,621; contingency and renewal reserves \$2,327,258; sinking fund reserves \$3,164,698, and general and special reserves of \$1,579,656.

The initial development of the Commission was an 800-h.p. installation on the Mushamush River, which went into operation in 1921 and delivered 192,000 kwh. in the first complete year of operation. This and later developments are shown in Table 13.

13.—Present Developments with Initial Capacities of Undertakings of the Nova Scotia Power Commission

¹ Minimum head.

² Distribution system only.

³ Rated in kilowatts.

The nine systems comprised 2,150.61 miles of combined transmission and distribution lines and served 35 wholesale and 13,053 retail customers at Nov. 30, 1947. Nineteen generating stations and 40 generating units are in service with a total installed capacity of 79,049 h.p. The total delivery to customers, which is somewhat variable, has reached 249,449,505 kwh. per year.

The Dickie Brook hydro-electric development of the Antigonish System now under construction provides for immediate installation of 2,900 h.p. and an additional 1,450 h.p. when required.

Preliminary work is being carried on for the construction of a steam plant in Pictou County which is expected to begin operation in 1950. This plant will have an initial installation of 10,000 kw.

Deep Brook hydro-electric development on the Mersey River, now in process of design, will add 12,000 h.p. to the Markland System. It is scheduled to start operation early in 1950.

New Brunswick.—The New Brunswick Electric Power Commission was incorporated under the Electric Power Act, 1920. Generating stations owned and operated by the Commission are as follows:—

<u>Plant</u>	<u>Type</u>	<u>Capacity</u> h.p.
Musquash	Water power.....	10,000
Grand Lake.....	Steam.....	26,800
Kouchibouguac.....	Water power.....	200
Grand Manan.....	Diesel.....	310
St. Quentin.....	Diesel.....	280
St. Stephen ¹	Diesel.....	600
TOTAL CAPACITY.....		38,190

¹ Operated from August, 1947.

The Musquash, Grand Lake and Kouchibouguac plants are inter-connected and operate in parallel at all times.

Transmission Lines.—The transmission system consists of a 66,000-volt line from Musquash to Moncton, and five lines from Grand Lake, viz., two 33,000-volt lines to Fredericton, one 66,000-volt line to Newcastle, one 66,000-volt line to Moncton, and one 66,000-volt line from Coal Creek to Hampton.

Power is sold *en bloc* to the cities of Saint John, Moncton, Fredericton and the town of Sussex.

The statistical information given below shows the growth of the Commission's undertakings since 1924.

14.—Growth of the New Brunswick Electric Power Commission, Years Ended Oct. 31, 1924, and 1943-47

Quebec.—The National Electricity Syndicate, 1937 (1 Geo. VI, c. 24), was established to develop electricity generating plants and distributing systems in the Province. It was abolished in 1940 (4 Geo. VI, c. 22) and its powers, duties, and contractual obligations were then transferred to the Quebec Streams Commission.

The Quebec Streams Commission.—Created in 1910 by 1 Geo. V, c. 5, and given additional powers by 3 Geo. V, c. 6 (see R.S.Q., c. 46) and by 20 Geo. V, c. 34, the Commission was authorized to ascertain the water resources of the Province, to make recommendations regarding their control, to construct certain storage dams and operate them so as to regulate the flow of streams. The Commission has assisted companies engaged in such work by the systematic collection of data on the flow of the principal rivers and on the meteorological conditions, by investigation of numerous water-power sites and determination of the longitudinal profile of a large number of rivers, but mainly by the regulation of the flow of the principal power streams through the construction of storage dams.

From 1912 to 1925, a number of storage reservoirs were built or acquired by the Commission, charges being made to benefiting companies to cover interest and amortization on the capital invested as well as the cost of operation. Since 1925, companies or persons have availed themselves of the latitude given them by R.S.Q. 1925, c. 46, s. 6, to build the necessary dams; such storages have been transferred to and are operated by the Commission, the cost of operation only being charged annually to the interested companies or persons. In all, the Commission now controls and operates 28 storage-reservoirs in the Province.

Among the rivers controlled by the Commission, either by means of dams on the rivers themselves or by controlling the outflow of lakes at their headwaters are: the St. Maurice, now developing 1,110,550 h.p.; the Gatineau, 528,000 h.p.; the Lièvre, 274,000 h.p.; the St. Francis, 100,000 h.p.; the Chicoutimi, 41,400 h.p.; the Au Sable, 33,200 h.p.; the Metis, 15,700 h.p. The Commission also operates nine reservoirs on Rivière du Nord, two in the watershed of Ste-Anne-de-Beaupré River, and one at the outlet of Lake Morin, on Rivière-du-Loup (en bas).

Reservoirs not Controlled by the Province.—Among storage reservoirs not controlled or operated by the Commission are: the Lake St. John, the Lake Manouane and Passe Dangereuse on the Peribonca River, and the Onatchiway on the Shipshaw River; the Temiscouata Lake on Madawaska River, controlled by Gatineau Power Company; Memphremagog Lake on the Magog River, controlled by Dominion Textile Company; Temiscamingue and Quinze Lakes on the Ottawa River, controlled by the Department of Public Works of Canada; Kipawa Lake on the Ottawa River, controlled by Canadian International Paper Company; etc.

Power developments on the Saguenay River, benefiting from the Peribonca and Lake St. John reservoirs, amount to 1,950,000 h.p. since the Chute-à-Caron (Shipshaw) project has been completed.

The Quebec Hydro-Electric Commission.—The Quebec Hydro-Electric Commission was established by 8 Geo. VI, c. 22, with the object of supplying power to the municipalities, industrial or commercial undertakings and citizens of the Province of Quebec at the lowest rates consistent with sound financial administration.

On Apr. 15, 1944, in accordance with the provisions of this enactment, the Commission took over: (a) the system of Montreal Light, Heat and Power Consolidated for the generating and distributing of electricity; (b) the undertaking of Montreal Island Power Company for the generating and distributing of electricity; and (c) all the shares of the capital stock of Beauharnois Light, Heat and Power Company. Thus, Quebec Hydro-Electric Commission acquired the control, among other assets, of the following hydro-electric plants:*

<i>Hydro-Electric Plant</i>	<i>River</i>	<i>Installed Capacity</i>
Cedars	St. Lawrence	200,000 h.p.
Chambly	Richelieu	9,000 h.p.
Sault-au-Récollet	Rivière-des-Prairies	45,000 h.p.
Beauharnois	St. Lawrence	680,000 h.p.

The Commission operates a public utility system which supplies electric light and power requirements to Greater Montreal and surrounding districts embracing a population of nearly 1,500,000.

* The Commission also purchases 175,000 h.p., mainly from the Shawinigan Water and Power Company.

From the Cedars Plant, electric energy is supplied to the Aluminum Company of America at Massena, N.Y., and through Beauharnois Light, Heat and Power Company power is sold to the Hydro-Electric Power Commission of Ontario. The sales involved are in the neighbourhood of rates of 100,000 h.p. to Massena, N.Y. and 250,000 h.p. to Ontario.

15.—Growth of the Quebec Power Systems, 1935-47

Year	Municipalities Served	Customers Served	Power Distributed	
			Total	Primary

Totals	827,000	942,000	897,000	883,000	947,000	980,000

In addition to the ownership and operation of these generating and distribution systems, the Quebec Hydro-Electric Commission administers the 48,000-h.p. Upper River plant at Rapid VII. Primary power statistics for this Northern Quebec System (Cadillac-Noranda district) are as follows: 1943, 15,030 h.p.; 1944, 16,820 h.p.; 1945, 14,720 h.p.; 1946, 15,750 h.p.; and 1947, 18,140 h.p.

Ontario — *The Hydro-Electric Power Commission.* — An account of the inception and operations of the Commission is given at pp. 377-378 of the 1940 Year Book.

Since 1945 the Commission has been engaged in implementing the power development program for which plans were started before the termination of the Second World War. During the past year, however, the Commission again found it necessary to revise its plans to cope with the ever-increasing magnitude of prospective demands.

The total generating capacity available to the Commission in 1947, including its own generating plants and the purchased power contracts, aggregated 2,050,000 kw. (2,748,000 h.p.). The power plants authorized for construction (with an

additional power purchase contract) will add, during the next few years, a capacity of 704,000 kw. (943,000 h.p.) making a total of 2,754,000 kw. (3,691,000 h.p.) as shown in the accompanying statement.

Hydro-Electric Power Commission Statistics.—The Annual Reports of the Commission present in great detail descriptions and statistics of operation, construction, municipal work, transmission and distribution. The Commission exercises supervisory functions over the electrical utilities owned and operated by the partner-municipalities.

The Commission was established in the early years of the twentieth century. The initial capital expenditure required to serve about twelve municipalities amounted to approximately \$3,600,000. At Oct. 31, 1946, the total capital investment amounted to \$545,545,202 of which \$393,339,254 represented investments by the Commission in generating plants, transmission systems, etc., including electric railway and other properties operated by the Commission for the major systems under their control, and \$152,205,948 were investments by municipalities in local distributing systems of their own, including other assets. Similarly, total reserves of the Commission and of the municipal electrical utilities for sinking fund, renewals, contingencies and insurance purposes amounted to \$414,830,047, of which \$276,932,621 represented reserves of the Commission and \$137,897,426 of the municipalities.

Statistics of Urban Municipal Electrical Utilities of Ontario Served by the Commission.—Statistics of the assets and liabilities of the electrical departments of urban municipalities served by the Hydro-Electric Power Commission show, for 1946, total assets of \$222,034,483 as compared with liabilities of \$13,736,601. Of the difference \$120,008,908 was allotted as reserves. In computing the percentage of net debt to total assets, the equity in the provincial system is not taken into account. Between 1933 and 1946 total assets increased by \$86,255,813 while total liabilities decreased by \$36,184,153.

*Rural Electrical Service in Ontario.**—During past years substantial progress has been made in Ontario in the field of rural electrification, and the Commission's rural operations are now an important feature of its work. The Ontario Govern-

* Legislation passed concerning rural power is as follows: the Power Commission Act (R.S.O. 1937, c. 62); the Rural Hydro-Electric Distribution Act (R.S.O. 1937, c. 64); the Rural Power District Loans Act (R.S.O. 1937, c. 65); and the Rural Power District Service Charge Act (R.S.O. 1937, c. 66).

ment, pursuant to its policy of promoting agriculture—a basic industry—contributes, in the form of ‘grants-in-aid’, 50 p.c. of the initial capital cost of distribution lines and equipment. In 1930, the Ontario Government passed legislation providing for advances up to \$1,000 to actual farm owners of lands and premises in rural power districts for the installation of electrical wiring, the purchase of equipment and providing for the fixing of low maximum service charges for all classes of rural Hydro service.

New Uniform Rural Rate Structure.—A new uniform rural rate structure, for the sale of energy, was placed in effect on Jan. 1, 1944, for all rural Hydro service throughout the Province, and replaced the numerous rural rate schedules previously in effect.

The new energy rates consist, essentially, of a three-step energy charge as follows:

- (1) A first block or number of kilowatt-hours of energy consumption in the billing period, charged for at 3½ cents gross per kilowatt-hour;
- (2) A second block or number of kilowatt-hours of energy consumption in the billing period, charged for at 1.6 cents gross per kilowatt-hour; and
- (3) All remaining kilowatt-hours of energy consumption in the billing period, charged for at 0.75 cents gross per kilowatt-hour.

In addition, the service charge in use prior to Jan. 1, 1944, has been eliminated in the case of farm and commercial service, reduced by 50 per cent in the case of hamlet service and changed to an annual fixed charge in the case of summer service.

19.—Electrical Service to Rural Power Districts Operated by the Ontario Hydro-Electric Power Commission, Years Ended Oct. 31, 1943-46

Manitoba.—The Manitoba Power Commission commenced its operations in 1919 under the authority of the Electrical Power Transmission Act. This Act empowered the Commission to make provision for generating electric energy, to enter into contracts for the purchase of power in bulk from generating agencies, and for its transmission and sale to municipalities, corporations and individuals. The first stretch of transmission line was completed in 1920 from Winnipeg to Portage la Prairie.

For the first ten years power was purchased in bulk from the Winnipeg Hydro Electric System. At the expiration of this period, the Seven Sisters Agreement between the Manitoba Government and the Winnipeg Electric Company provided for the reservation of a block of power for the Power Commission.

The Manitoba Power Commission Act of 1931 provided for the reorganization of the utility's administration. Bulk contracts were cancelled and service begun direct to the consumer, municipalities and towns having contracts for street lighting only. This made possible the adoption of a policy by which the Commission might eventually establish standard rates for all towns and villages regardless of distance from the source of supply or the sparseness of population.

The expansion of the utility since 1931 shows the importance of this reorganization. In 1931 there were 56 cities, towns and villages on the System; 243 communities were served in 1947. Revenue increased from \$700,000 to over \$2,000,000. Rate reductions, meanwhile, have reduced the average customer cost per kilowatt-hour 50 p.c. in the past 15 years.

The successful growth of the network to the majority of the cities, towns, and villages of the Province, made it possible for the Commission to consider a project of extending electric service to the farms. The Manitoba Electrification Enquiry Commission appointed by the Provincial Government in 1942 to study farm electrification in the Province, reported electric service could be brought to at least 90 p.c. of the farms in the Province. It was estimated this project would involve the construction of 40,000 miles of transmission line at a cost of \$35,000,000.

Previously, individual or small groups of farms situated near existing low voltage transmission lines were connected on a contributory basis.

Construction under the farm program began on an experimental basis in 1945 when transmission lines were built to serve 674 farms in seven test areas. Under the farm electrification program the Commission bears the expense of building the power line right into the farm-yard, the farmer being responsible for his yard and interior wiring, and for the purchase of appliances. Construction was to proceed at the rate of 5,000 farms annually, but post-war shortage of line materials restricted this to 1,500 farms in 1946 and 3,500 in 1947.

Substitution of Manitoba jack-pine poles and the establishment of a transformer factory and the development of miscellaneous pole-line hardware manufactures in the Province, enabled the Commission, in 1948, to return to the original plan of construction to 5,000 farms. Estimated expenditure in 1948 for the farm program is \$4,000,000.

In conjunction with the farm program, the Commission is constructing lines to serve every community having a population of at least 20 persons, located within the practical service area of the Province. Following the connection of 103 communities scheduled to receive service during 1948 and 1949, 346 cities, towns, villages and hamlets will be supplied with power by the Commission.

Saskatchewan.—The Saskatchewan Power Commission was established in 1929 under the Power Commission Act (R.S.S. 1940, c. 33) which authorized the Commission to manufacture, sell and supply electric energy, to acquire and develop water-power sites, to acquire or construct oil and steam plants, to construct transmission lines, to purchase power and to enter into contracts with municipalities for the supply of electric energy.

During the years 1929 to 1945, the Commission purchased certain generating plants, and constructed and purchased transmission lines and also distribution systems in towns and villages. These were improved, enlarged or supplemented. Particulars of these acquisitions and constructions are given in the 1941 Year Book and subsequent editions.

Control and regulatory powers regarding franchises for the supply of electric energy and the rates to be charged therefor are conferred upon the Local Government Board by Part III of the Public Utilities Companies Act (R.S.S. 1940, c. 118). The Commission is given certain control and regulatory powers regarding public electrical utilities under Part III of The Power Commission Act.

On Jan. 1, 1947, Dominion Electric Power Limited, which up to that date had been operated as a wholly owned subsidiary, was completely absorbed by the Commission, and on the same date the properties of Canadian Utilities Limited in Saskatchewan, with the exception of its Lloydminster plant, were acquired and added to the Commission's system.

Including the properties acquired from the three private companies mentioned, the Commission now owns and operates 3,550 miles of transmission line and distribution systems in 343 cities, towns and villages which are served from the system. Steam generating plants with a total installed capacity of 65,000 kw. are located at Saskatoon, North Battleford, Prince Albert, Estevan and Tylerton, while diesel plants with a total installed capacity of 28,770 h.p. are located at Swift Current, Wynyard, Tisdale, Watrous, Humboldt, Leader, Maple Creek, Unity, Assiniboia, Biggar, Canora, Davidson, Eastend, Grenfell, Gull Lake, Herbert, Hudson Bay, Kerrobert, Kindersley, Meadow Lake, Melfort, Melville, Shellbrook, Nipawin, Perdue, Rosetown, Shaunavon, Wilkie and Yorkton. The Commission also purchases several blocks of power from and contracts for the interchange of power with private interests. Electric energy is sold retail direct to consumers except in the cities of Saskatoon, North Battleford and Swift Current, and the town of Battleford, where energy is furnished in bulk to the municipal corporations and retailed by them to the consumers. The number of customers served direct at the end of 1947 (including rural services) was 45,087, while the number served by municipalities buying power in bulk from the Commission was 18,718.

One hundred and thirty-two cities, towns, villages and hamlets were added to the Commission's system during 1947, including 64 taken over from Dominion Electric Power Limited and Canadian Utilities Limited.

In 1947 approximately 465 miles of transmission lines were constructed. Substantial alterations were also made in existing lines radiating out of the city of Saskatoon including the installation of a new under-ground cable from the Saskatoon plant to the Commission's substation and switch centre on the out-skirts of the city.

The 20,000 h.p. turbo-generator which was under erection at Saskatoon during 1946, was placed in service in January, 1947. The construction of an addition to the power-plant building and the installation of a new steam generator and a new steam turbo-generator at the Estevan plant, were in progress at the end of the year.

The capacity of a number of the Commission's diesel plants was increased during the year by a total of 3,700 h.p. accounted for by local increases as follows: Swift Current 1,250 h.p., Wynyard, 1,250 h.p., Canora 450 h.p., Meadow Lake 450 h.p., Kindersley 300 h.p.

A 520 h.p. natural-gas electric generating unit was also placed in operation in the Unity Plant, while two 875 h.p. natural gas electric units for use in the same plant were purchased and delivered.

Regina and Weyburn as well as a number of small towns and villages own and operate their municipal plants and distribution systems. The plant and distribution system in the city of Moose Jaw, and a short transmission line south of that city are owned and operated by a private company.

20.—Growth of the Saskatchewan Power Commission, 1934-47

NOTE.—Figures for the years 1929-33 inclusive will be found at p. 499 of the 1947 Year Book.

Year	Municipalities Served		Customers Served		Total Power Generated	Total Power Purchased	Capital

Alberta.—Public ownership of power-generating and distributing systems in Alberta is confined to certain urban municipalities. The regulatory authority over privately owned systems is the Board of Public Utility Commissioners, which has jurisdiction over the distribution and sale of electricity. The Board has power to hold investigation upon complaint made either by a municipality or by a utility company and, following such investigation, may fix just and reasonable rates.

There are three private utility services in the Province, the Calgary Power Limited, Canadian Utilities Limited, and Northland Utilities Limited. A short synopsis of these services is given below:

(1) *Calgary Power Limited.*—This Company has five hydro generating plants on the Bow River and its tributaries, west of Calgary. These plants, the Horseshoe Falls, Kananaskis Falls, Ghost River with a storage reservoir capacity of 74,000 acre feet of water, Cascade, and Barrier Plants, total 105,000 h.p. The Barrier Plant, completed in 1947, is operated by remote control. In addition to the Ghost storage, the Company has reservoirs at Lake Minnewanka and the Upper Kananaskis Lake.

Power from these 5 plants together with that received under interchange agreements with the cities of Lethbridge and Edmonton, the East Kootenay Power Company Limited and the 14,000-h.p. steam plant in Calgary is fed into a transmission network which supplies the entire electrical requirements of the cities of Calgary and Red Deer and 170 towns, villages and hamlets in central and southern Alberta. Calgary Power Limited transmission system comprising 30,000 miles of lines of all voltages extends from the United States boundary to Westlock, 60 miles north of Edmonton, and in the central part of the Province extends west to the Brazeau coal

fields at Nordegg and east to Macklin, Sask. Calgary and Lethbridge and the towns of Ponoka, Macleod and Cardston are supplied upon a wholesale basis and own their own distribution systems. All other points upon the system are supplied on a retail basis.

The Company has 3,799 miles of transmission lines and 431 miles of pole lines.

An extensive farm electrification program is in progress and at Dec. 31, 1947, the Company was supplying approximately 2,666 farms.

The Company's transmission systems are designed with a view to future expansion.

(2) *Canadian Utilities Limited.*—Towns and villages northeast of Drumheller are supplied from a 13,500 kw. steam plant in that city by Canadian Utilities Limited, while towns and villages north and east of Vegreville are served from a new gas-fired steam plant being built in Vermilion. There are also diesel stand-by plants at Lloydminster and a tie line with the first utility near Holden.

This utility also serves the areas around Grande Prairie from a diesel engine plant located in that centre. Service to the rural areas is gradually being expanded and up to the present time 550 customers are being served.

(3) *Northland Utilities Limited.*—This Company, with headquarters in Edmonton, supplies electric energy to 3,800 consumers in 15 towns and villages in northern Alberta. Diesel generating plants are located in Jasper, Mayerthorpe, Athabasca, High Prairie, McLennan, Peace River, Fairview and Chauvin. Low-voltage transmission lines extending from the generating stations supply electricity to 56 farms and to 7 villages. The Company's program for 1948 calls for extension of its service to supply 5 other villages. Farm service will also be extended to a large number of farms in the Peace River District of Alberta.

This Company also serves the communities of Dawson Creek, Pouce Coupe and Rolla in the Peace River block of British Columbia, which is tributary to Alberta areas although not located in the Province.

Other Privately Owned Utilities.—Edmonton generates power from coal and operates its own distribution system; in addition, there is a reciprocal arrangement with one of the privately-owned utilities for exchange of power at peak periods. Calgary, Red Deer, Lethbridge, Macleod, Cardston and Ponoka own their distributing systems but purchase power from the same private source as Edmonton. Medicine Hat owns its own power plant and distribution system and furnishes power to the adjacent town of Redcliff.

Villages and hamlets beyond the reach of the large utility companies are served by small privately-owned power plants.

British Columbia.—The British Columbia Power Commission was appointed Apr. 17, 1945, under the provisions of the Electric Power Act, "to provide for improving the availability and supply of electric power". In addition to acquiring the electrical systems of the West Canadian Hydro Electric Corporation, the Nanaimo-Duncan Utilities Limited, the Columbia Power Company Limited, the National Utilities Limited and the Kamloops properties of the British Columbia Electric Railway Company Limited, the Commission also purchased several smaller privately-owned utilities and municipal plants throughout the Province, and pending development of its own source of power, purchased electric energy for distribution at several points on Vancouver Island.

The Commission's main development on Vancouver Island, the building of a hydro-electric plant, the "John Hart Development", on Campbell River, designed for an ultimate capacity of 180,000 h.p., was officially opened on Dec. 15, 1947. The first two units comprising 50,000 h.p. now supply power to the territory north of Duncan over a 104-mile—132,000 volt double circuit transmission line making electric energy available to industries that may be attracted to this readily accessible area of Vancouver Island.

On the mainland another major construction project is underway at Whatshan near the west side of Upper Arrow Lake. This is the result of several surveys to locate a suitable source of power in the interior of the Province. The plan calls for immediate construction of two 15,000 h.p. units and a 75-mile—138,000 volt transmission line to Vernon in the rich Okanagan Valley. In this way a large area in the interior of the Province will be served by the Commission as a 65-mile—63,000 volt line is now under construction between Vernon and Kamloops on the main line of both transcontinental railways.

Early in 1948 the Commission owned and operated 21 generating stations comprising 2 steam plants, 9 hydro plants (some of which were operated in conjunction with small diesel plants) and 15 diesel plants. The total rated capacity of these plants was 68,120 kva. Electricity was distributed in 18 distinct power districts and supplied wholesale to one municipality. In 11 of these areas a promotional rate structure has been introduced to "permit and encourage the maximum use of power". Over 26,500 customers were being served by the Commission at the beginning of 1948. Of this figure 5,200 represented new services installed by the Commission, a growth of 20 p.c. in approximately a two-year period.

Subsection 3.—Private Ownership of Central Electric Stations

Summary statistics of privately owned central electric stations are given for the years 1930 to 1946 in Table 21.

21.—Summary Statistics of Privately Owned Central Electric Stations, 1930-46

Year	Power Plants	Customers	Electric Energy Generated	Power Equipment ¹

1946.....	397	826,091	26,997,716	6,104,383	6,301,996

¹ Exclusive of auxiliary equipment.

The predominant position of Quebec in the electric-power field can be seen from the column in Table 22 showing electric energy generated. Of the total power generated in Canada by all central electric stations in 1946, 45 p.c. was generated by privately owned or commercial stations in the Province of Quebec; this percentage decreased from 57 in 1943 as a result of the transfer in 1944 of the Montreal Light, Heat and Power Company and the Beauharnois Power Company to the publicly owned Quebec Hydro-Electric Commission.

All stations in Ontario produce less than one-half as much power as the Quebec stations and only 20 p.c. of the total for Ontario stations is produced by privately owned stations.

22.—Privately Owned Central Electric Stations, by Provinces, 1946

¹ Power generation in Saskatchewan is entirely by fuel plants. There is one hydro-electric station but the power is used in Manitoba and the statistics are included with those of Manitoba.

Section 3.—Total Development of Electric Power from All Available Sources

In Section 1 of this Chapter the total water-power resources and the proportion that has been so far developed are dealt with. Table 3 of that Section analyses the hydraulic turbine installation by the proportions in central electric stations, in pulp and paper mills, and in other industries. This is a useful picture, but it does not take into account electric power that is developed in central electric stations or in other industries from sources other than hydraulic.

Section 2 covers the central electric station industry including those under the public ownership of Provincial and Municipal Governments, and those under private ownership. Neither of these two Sections, however, gives a complete picture of the total electric power developed in Canada. All of the hydraulic energy developed is not converted to electric power: there are a number of water wheels and water turbines that are used for direct drive and are not geared to electric generators. On the other hand, certain central electric stations such as some in the Maritime Provinces and others in the Prairie Provinces generate electricity from steam or internal combustion engines. It is the purpose of this Section to show the total electric power generated from all available sources. Most of the power comes, of course, from the central electric stations, the figures having been given in Table 4 of

Section 2, p. 497. The total kilowatt hours of electric power generated by central electric stations is divided into that generated from water power and that generated from thermal engines of all kinds.

As shown in that table the total electric power generated by central electric stations in 1945 was 40,130,054,000 kwh. To get a complete picture, the power generated by manufacturing industries for their own use and the power generated by the primary mining industry for use in its own operations must be added. There are a few other sources of electric energy such as electric railways which produced 10,810,700 kwh. during 1945. This production has been taken into the annual totals shown in Table 23. Also, there are numerous small lighting and power plants on farms, rural homes, summer resorts, etc., where electricity from central electric stations is not available—there are no available data regarding these. The following table gives available data separately and as a combined total. Of the total electric power generated in Canada in 1946, 94 p.c. is shown to have been developed in central electric stations and of this 2.3 p.c. was generated by thermal engines (see Table 4, Sect. 2), the remainder having been produced hydraulically. Of the 6.5 p.c. generated by industry for its own use 6.1 p.c. was developed by the manufacturing industries and 0.4 p.c. by the mining industry.

23.—Total Power Generated, by Central Electric Stations, Manufacturing and Mining Industries, 1927-46

¹ Includes power generated by Electric Railways for use in their own operations.

Section 4.—Power Equipment in Canadian Manufacturing and Mining Industries

Table 24 shows the power equipment installed in the manufacturing and mining industries of Canada from 1934 to 1945. The figures for the 12 years show that primary power increased from 1,685,819 h.p. to 2,304,206 h.p. or by 36.7 p.c. while the installation of electric motors operated by purchased power shows an increase of no less than 2,413,976 h.p. In considering the increase in the latter

figures, it must be borne in mind that the shift from belts and shafting to individual motors at each machine does not necessarily mean that an amount of power is used equivalent to the increased capacity: there is always a margin by which installed equipment exceeds the simultaneous load.

Of the total primary power installed in 1945, manufacturing establishments accounted for 87.7 p.c., while of the total electric motors operated by purchased power, manufacturing accounted for 82 p.c. and mining for 18 p.c.

The mining industry showed an almost uninterrupted increase in the amount of equipment operated by purchased power from 1934 to 1941; in 1937 a very sharp rise over the 1936 figure occurred; this would indicate a tendency of mining companies to rely more and more upon purchased power rather than to attempt to generate their own, a very natural tendency in northern Ontario and Quebec where water power is abundant and fuel scarce.

In manufacturing, a steady growth is indicated in total power equipment installed, total electric motors and in motors operated by purchased power.

Section 5.—Fuel Used in Canadian Industry

Fuel is used quite generally throughout the industrial field for the generation of power by means of steam- and internal-combustion engines. It is used also for the heating of plants and for providing the heat necessary to some manufacturing processes. The most important industries where heat is applied to materials to facilitate or accomplish a desired transformation are: foundries; brick, tile, lime and cement works; petroleum refineries; the glass industry; distilleries; food preparation plants; rubber goods industry; etc. The figures of Table 25 cover fuel used for such heating purposes and for power. Fuels that constitute the raw materials to be transformed, such as coal in the coke and gas industries, crude petroleum in the refining industry and electricity used in such metallurgical processes as the electrolytic refining of non-ferrous metals, are excluded.

The value of fuel consumed in the manufacturing and mining industries in 1945, showed an increase of 60 p.c. over 1940. Of the 1945 fuel account, the requirements of Ontario amounted to 49.7 p.c. of the total, of Quebec 27.6 p.c., of British Columbia 6.9 p.c. and of Nova Scotia 5.3 p.c.

Coal is, of course, by far the most important, on the basis of dollar values, of the various kinds of fuels used in industry, and in 1945 accounted for 56.6 p.c. of the total.

Fuel oils ranks second with 21.9 p.c. and gas (manufactured gas 9.5 p.c. and natural gas 2.2 p.c.) third in importance. Gas as a fuel is particularly important in Ontario. Natural gas is obtained from the southwestern portion of the Province and coal gas from the coke plants of the steel city Hamilton, much as the Province of Quebec draws coal gas from the coke plants at Montreal.

The use of natural gas is also relatively important in Alberta in both manufacturing and mining industries in fact in the mining industry Alberta used, in 1945, gas which was valued at nine-tenths of the total used in mining operations generally.

The use of fuel oils in industry shows a very rapid rise especially during the war years between 1939 and 1943. The value of fuel oils consumed by Canadian industry was more than doubled. Total consumption rose from a value of \$10,125,388 in 1939 to a peak of \$23,909,494 in 1943, by 1945 the comparable figure was \$29,897,657.

Subsection 5. Leading Manufacturing Industries.....	563	SECTION 6. MANUFACTURING INDUSTRIES IN URBAN CENTRES.....	596

This Chapter deals with manufacturing industries in Canada in two main Parts. Part I gives general analyses of manufactures in the Dominion including: the historical development of manufacturing in Canada in so far as statistical data are available; production by industrial groups and individual industries, i.e., a detailed treatment of current production under various groupings and individual industries; general analyses of the principal factors in manufacturing production under such sub-headings as capital, employment, salaries and wages, size of establishment, power and fuel. Part II covers the provincial and local distribution.

With regard to the first section of Part I, dealing with historical development, it is impossible to give absolutely comparable statistics over a long period of years. From 1870 to 1915 statistics were collected only in connection with decennial or quinquennial censuses, and there was inevitably some variation in the information collected. The annual Census of Manufactures was instituted in 1917 and, while numerous changes have been made since then in the information collected and the treatment of the data, an effort has been made to carry all major revisions, in so far as possible, back to 1917.

The far-reaching influence of the War of 1914-18 was, of course, the outstanding factor in the growth recorded prior to the Second World War. It was during the years 1914-18 that Canadian manufactures began to develop on a really large scale.

The tremendous increase in production during 1939-45 is indicated by the increases in some of the main factors of production between 1939 and the highest point attained during the War. For manufacturing as a whole there was an increase of 161 p.c. in the gross value of production, 162 p.c. in the value added by manufactures, 89 p.c. in the number of persons employed, and 175 p.c. in the salaries and wages paid.

By 1945, gross value of manufacturing production was 137 p.c. above that of 1939, but 24 p.c. below that of 1944. The number of employees and the salaries and wages paid were 70 p.c. and 150 p.c., respectively, above those of 1939. Although still high, they reflected the decline to more normal productions compared with the peak of the War period.

* Revised under the direction of W. H. Losee, Director, Census of Industry and Merchandising Division, Dominion Bureau of Statistics, by A. Cohen, Chief, General Manufactures Section.

PART I.—GENERAL ANALYSES OF MANUFACTURING IN THE DOMINION

Section 1.—Growth of Manufacturing in Canada

Subsection 1.—Production of Manufactured Products

This section gives a picture of the growth of manufacturing, in general, as shown by comparable principal statistics, i.e., establishments, capital, employees, salaries and wages paid, cost of materials, and values of products. Other useful comparisons are made in Table 4 and figures of consumption are given in Table 5. Tables 6 and 7 show volume comparisons.

1.—Historical Summary of Statistics of Manufactures for the Dominion, 1917-46

NOTE.—Statistics of manufacturing from 1870 have been published, but between that year and 1917 they are not on a comparable basis to the series given below. They will be found at p. 363 of the 1943-44 edition of the Year Book. Statistics of the non-ferrous metal smelting industries were included in manufactures for the first time in 1925.

¹ In accordance with a resolution passed by the Conference of British Commonwealth Statisticians, 1935, the net value of production is now computed by subtracting the cost of fuel and electricity as well as the cost of materials from the gross value of the products. The figures for 1924 and later years have, therefore, been revised in accordance with this resolution. The revision could not be carried farther back as statistics for cost of electricity are not available for years prior to 1924.

² A change in the method of computing the number of wage-earners in the years 1925 to 1930, inclusive, increased the number somewhat over that which the method otherwise used would have given. In 1931, however, the method in force prior to 1925 was re-adopted. The figures for 1931 and later years are, therefore, comparable with those for 1924 and earlier years.

³ Not collected.

¹ See footnote 1, Table 1.² See footnote 2, Table 1.³ Information not collected.

The figures in Table 4 trace the tendencies in Canadian manufacturing industries as clearly as possible through the latest period of their development. In analysing statistics of production and materials used, it should be borne in mind that, due to the inflation of values from 1914 through the immediate post-war period and the drop in prices of commodities during the depressions following 1921 and 1930, the figures for these periods are not completely comparable. One very important figure, however, which shows the trend of development clearly, is concerned with the use of power. The total horse-power employed increased from 1,658,475 in 1917 to 6,606,651 in 1945, an increase of about 298 p.c. in 28 years. In the same period, horse-power per wage-earner showed an interrupted trend from 3.06 to 10.82 in 1933 and 9.46 in 1939. The significant feature is the increase in both the absolute figure of power employed and the average per wage-earner. Other interesting comparisons are the trend of value added by manufacture, per employee, and of average salaries and wages paid since 1929.

¹ A change in the method of computing the number of wage-earners in the years 1925 to 1930, inclusive, increased the number somewhat over that which the method otherwise used would have given. There was, therefore, a proportionate reduction in the averages for 1925-30 per employee and wage-earner, as compared with what these averages would have been under the other method. In 1931, however, the method in force prior to 1925 was re-adopted. The figures for 1931 and later years are, therefore, comparable with those for 1924 and earlier years.

² Not collected.

³ Net values of products; see footnote 1, Table 1.

Subsection 2.—Consumption of Manufactured Products

One of the beneficial results of adopting the same classification for external trade and for production is exhibited in Table 5, where the value of commodities made available for consumption in Canada is derived from these statistics. For example, the value of all manufactured commodities made available in 1946 was \$7,724,273,871, a figure obtained by adding to the value of manufactured products the value of the imports of manufactured and partly manufactured goods and deducting the value of the exports.

In past years there have always been large amounts of manufactured animal, wood and non-ferrous metal products available for consumption in Canada with considerable surplus left for export. With the commencement of the War, however, it was necessary to export more and more of such goods to the United Kingdom, and while this was done mainly by increasing production, Government control of consumption at home grew stronger as the War advanced. In the case of manufactured vegetable products, the figures for 1946 showed large excesses of exports over imports for such products as cereal foods (including flour), canned and dehydrated vegetables, etc. Excesses of imports were chiefly confined to cocoa, tea, coffee and preserved fruits and fruit juices that cannot be produced in Canada.

On balance, Canada, in the past, imported large quantities of iron and steel, textile and non-metallic mineral products in spite of large home production. The urgent requirements for munitions of war brought about an expansion of the iron and steel, chemical and non-ferrous metals industries that will enable Canada to meet most requirements for home consumption in the future.

5.—Consumption of Manufactured Products, 1933-1946

¹Imports and exports of manufactured and partly manufactured goods for the years 1928 to 1938 are for the fiscal years ended Mar. 31 of the following years, while for 1939 to 1945 they are for the calendar year. Net imports are total imports less foreign products re-exported.

Section 2.—Value and Volume of Manufactured Products

Value of Manufactured Products.—In the interpretation of manufacturing values over a number of years, variations in the level of prices must be borne in mind, especially when such variations have been as great as those in the period since the annual Census of Manufactures was begun in 1917. The index number of

wholesale prices in Canada, on the 1926 base, compiled by the Dominion Bureau of Statistics, stood at 114.3 in 1917, 155.9 in 1920, 97.3 in 1922, 95.6 in 1929, 67.1 in 1933, 84.6 in 1937, 75.4 in 1939 and 103.6 p.c. in 1945. Index numbers of the prices of fully or chiefly manufactured goods were: 113.5 in 1917, 156.5 in 1920, 100.4 in 1922, 93.0 in 1929, 70.2 in 1933, 80.5 in 1937, 75.3 in 1939 and 94.0 p.c. in 1945.

Volume of Manufacturing Production.—Since real income is ultimately measured in goods and services, the growth of the volume of manufacturing production, as distinguished from its value, becomes a matter of great significance. The important thing to know is whether consumers are getting more goods and services, not whether they are expending more dollars and cents.

The index of volume (Table 6) is based on the quantities of manufactured products reported. The industry indexes are weighted according to the values added by manufacture. The weights and products were changed from the 1926 values in 1931, 1936 and then again in 1941. By changing the weights and products used in the construction of the index every five years, current changes in production are thereby reflected more accurately.

The physical volume of manufacturing production increased 50.2 p.c. from 1923 to 1929. When it is recalled that the population of Canada is estimated to have increased by only 11.1 p.c. during the same period, the growth of manufacturing production is indeed remarkable. Of this advance, the part resulting from an increase in the domestic demand due to growth of population would therefore be about 11.1 p.c. Exports of partly and fully manufactured goods increased from \$591,830,000 in the fiscal year ended Mar. 31, 1924, to \$686,876,000 in the fiscal year 1929-30, the increase in exports representing about 3.6 p.c. of the 1923 production. The remainder of the increase in production by 1929, or a margin equal to roughly 35 p.c. of the volume of manufactures of 1923, was, therefore, apparently absorbed by increases in capital equipment and by the rise in the standard of living of the population of Canada.

A similar analysis of the volume of manufactures since 1929 in relation to population and exports would show that the decline in the depression preceding the Second World War was due chiefly to reduced exports and a cessation in production of capital equipment. As a result of the expansion in production resulting from the demands created by the War, the physical volume of production in 1943 when production was at an all-time high increased by 76.6 p.c. since 1939 and by 85.1 p.c. since 1929. The chemical and allied products group, with an increase of 262.5 p.c., reported the greatest expansion in output since 1939. This was followed by the iron and its products group with an increase of 222.2 p.c., non-ferrous metal products 129.9 p.c., miscellaneous industries 68.0 p.c., non-metallic mineral products 55.6 p.c., animal products 40.4 p.c., textiles and textile products 33.7 p.c., vegetable products 24.6 p.c., and wood and paper products 21.4 p.c. There was also an increase in the volume of consumer goods. As was to be expected, the increase was not so great as that for the output of equipment and supplies needed by the Armed Forces. Drink and tobacco increased by 50.5 p.c., food 26.8 p.c. and clothing 24.7 p.c.

In 1945 the index of the physical volume of production at 165.3 represented a drop of 11.9 p.c. from the high mark attained in 1943. Chemicals and allied products had the sharpest decline of 34.9 p.c., non-ferrous metal products with 30.5 p.c.; iron and its products 24.6 p.c. and textiles and textile products 3.9 p.c. The

vegetable, wood and paper, animal, non-metallic mineral, and miscellaneous industries groups on the other hand reported an increase in the volume of production. The volume of consumers goods continued to rise with the drink and tobacco group reporting an increase of 21.2 p.c., followed by books and stationery with 12.3 p.c., personal utilities 12.1 p.c., food 9.8 p.c., house furnishings 4.3 p.c., and clothing 1.3 p.c. Industrial equipment and producers materials were both down with declines of 18.8 and 11.5 p.c., respectively. Vehicles and vessels also declined 22.4 p.c.

6.—Indexes of the Volume of Manufacturing Production, According to Component Material and Purpose Classifications, 1933-1945

(1935-39=100)

NOTE.—Figures for the years 1923-32 are given at p. 519 of the 1947 Year Book.

Section 3.—Production by Industrial Groups and Individual Industries

For the purposes of the Census of Manufactures, the main detailed analysis is made under a classification in which industries are grouped according to the chief component materials of the goods manufactured. This is, therefore, the grouping used in the historical series shown in Table 3. However, there are also less detailed analyses under the standard classification grouping given in Table 9, purpose groupings in Table 10 and under origin groupings in Table 12.

THE CHEMICAL INDUSTRIES IN CANADA*

A quarter of a century ago, in 1920, when commodity prices were at a peak, the output value for all chemical and allied industries in Canada was \$127,800,000. A major decline during the post-war recession after 1918 reduced output to \$88,600,000 in 1921 but this was followed by a period of steady improvement which

* Prepared under the direction of W. H. Losee, Director, Census of Industry and Merchandising, Dominion Bureau of Statistics, by H. McLeod, Chief, Mining, Metallurgical and Chemical Section.

carried the value to \$138,500,000 in 1929. Then came the depression years during which production fell, in 1933, to \$92,800,000 from which it then advanced steadily to the pre-war high of \$159,500,000 in 1939. Since then, there has been phenomenal expansion featuring the erection of many new plants and the manufacture of many new products. In 1946, the value of output was \$376,288,264.

In 1946, there were 1,017 operating establishments in the chemicals and allied industries and these were distributed across the country as follows: 534 in Ontario, 327 in Quebec, 64 in British Columbia, 37 in Manitoba, 18 in Alberta, 16 in Nova Scotia, 11 in Saskatchewan, 8 in New Brunswick and 2 in Prince Edward Island. Quebec accounted for 33 p.c. of the production and those in Ontario for 53 p.c.

The average employment in all these works was 37,278 employees and salaries and wages for the year totalled \$66,538,532. Details of the chemical process industries are given on pp. 544-550.

The chemical industries might be conveniently arranged in three groups: (1) to include the actual manufacture of heavy or fine chemicals; (2) to include the manufacture of allied products, such as coal tar and hardwood distillation products, paints, soaps, medicines, etc.; (3) to include the chemical process industries such as pulp and paper, electrolytic refining, etc. For statistical purposes the first two divisions are grouped under the heading of chemicals and allied products while the process industries are distributed amongst other industrial groups. This review will indicate in some detail the extent and diversity of the heavy chemical industry in Canada and briefer mention will be made of the allied and process divisions.

The Heavy Chemical Industry Group

Information regarding the beginning of the chemical manufacturing industry in Canada is very sketchy. The Census of 1890 showed the output of chemical plants at slightly more than \$2,000,000 but it seems certain that this total included some allied products as well as basic chemicals. At any rate, the industry at that time was very small—a sulphuric acid plant had begun operations a few years previously, the manufacture of methyl alcohol by the destructive distillation of wood had been started, some nitroglycerine was being made for use in explosives, and some ethyl alcohol was being produced. The next decade, however, saw the start of the electro-chemical industry with the building of a carbide plant at Niagara Falls, Ont., and a phosphorus works at Buckingham, Que. From the turn of the century to the outbreak of the First World War, there was continued expansion featuring the opening of large works to make carbide at Shawinigan Falls, Que., cyanamide at Niagara Falls, Ont., and electrolytic caustic soda at Windsor, Ont. With the First World War there came heavy responsibilities to manufacture special chemicals for munitions purposes and a number of new plants and extensions were erected. Some of these developments were essentially for war needs, such as the manufacture of trinitrotoluene, cordite, etc., and were discontinued soon after the Armistice, but others were of a fundamental nature and remained as part of the permanent industry. Outstanding among the latter was the synthetic acetic acid and acetone plant at Shawinigan Falls, Que.

The period between the two wars, 1918-39, was characterized by a steady advance in both volume and diversity of products including such outstanding developments as the manufacture of soda ash at Amherstburg, Ont., and of sulphuric acid from waste smelter gases at Copper Cliff, Ont., and at Trail, B.C.

In this period too there was consolidation within the industry through the merger of smaller units to form such concerns as Canadian Industries, Limited, and Shawinigan Chemicals, Limited. There was remarkable progress also in technical skill, in research, and in the training of personnel. When the Second World War broke upon the world, the industry was well fitted in these essentials to undertake the tremendous responsibilities that were to be faced.

In the transformation of Canadian industry for war production, probably no aspect was more important or more spectacular than the explosives and chemicals program. Before the outbreak of hostilities, the explosives industry in this country was occupied almost entirely on ordinary commercial requirements, and consequently the chemical industry lacked facilities to feed a large-scale munitions output. In October, 1939, under the Defence Purchasing Board, the future Chemicals and Explosives Branch of the Department of Munitions and Supply was set up to expand explosives production and to place the chemical industry on a parallel course of development. Soon great plants mushroomed up in every part of the country as three score separate projects involving expenditures of more than \$160,000,000 were undertaken, some being extensions and others entirely new works—some for explosives, some for shell filling, some for grenades, fuse powders and pyrotechnics, but about one-half for special chemicals required in the over-all program. It is estimated that the production of chemicals in Canada expanded threefold during the Second World War and reached a total value in 1944 of \$110,000,000.

With the end of hostilities some of these works were closed or dismantled but a number have been taken over by private concerns and have become part of the post-war industry. In 1948, the industry stands as one of the nation's leading activities. It supplies about 70 p.c. of the country's chemical needs, and in addition makes a substantial contribution to export trade. It has buildings and capital equipment valued at \$120,000,000, employs 10,000 people, and annually distributes \$18,000,000 for salaries and wages, and \$40,000,000 for materials, fuel and power. It includes some of the largest industrial establishments in Canada.

A few large concerns dominate the heavy chemical field of manufacture. First in value and diversity of output is the Canadian Industries, Limited, which has a chain of plants across the country. This Company, which is also dominant in the manufacture of allied lines, such as paints, fertilizers, cellophane, nylon, explosives, etc., is linked commercially with the E. I. DuPont de Nemours and Company, and the Imperial Chemical Industries, Limited, prominent chemical firms in the United States and in the United Kingdom, respectively. Other major producers in Canada are the North American Cyanamid, Limited; the Shawinigan Chemicals, Limited; the Consolidated Mining and Smelting Company of Canada, Limited; the Brunner-Mond Canada, Limited; the Nichols Chemical Company, Limited; the Electric Reduction Company of Canada, Limited; and the Dow Chemical Company of Canada, Limited. Two score or more smaller concerns complete the list.

Special War Chemicals—Among the special wartime developments of the chemical industry were the following: the manufacture of carbamate, an important requirement for use as a stabilizer and plasticizer in cordite, was begun in 1941 by Defence Industries, Limited, at Windsor, Ont. This project in turn necessitated a steady supply of monoethylaniline, an essential ingredient, so its manufacture was undertaken in 1941 by Shawinigan Chemicals, Limited, in a Government-

owned works at Shawinigan Falls, Que. Aniline for this purpose was imported at first, but at the end of 1941 the Naugatuck Chemicals, Limited, started its manufacture at Elmira, Ont., and in 1942 this Company began production of diphenylamine in a separate Government unit at the same location.

The manufacture of dibutyl phthalate, needed for smokeless powders, was started in 1942 by the Dominion Tar and Chemical Company, Limited, at its Toronto plant and by the Shawinigan Chemicals, Limited, at Shawinigan Falls. The former Company added a unit for phthalic anhydride in the same year and the latter concern a unit for butyl alcohol in 1943. Hexachlorethane, for smoke bombs, was produced by Defence Industries, Limited, at Shawinigan Falls and Windsor.

Most important of all special war projects in the chemical field is the Sarnia plant of the Polymer Corporation, Limited, for the manufacture of synthetic rubber, with its integrated units for making intermediate chemicals such as styrene, butadiene, etc. Erected by the Government at a cost of \$50,000 000 this huge development began operations in the autumn of 1943. In 1948, it was working at capacity to meet peacetime requirements.

Probably the next largest of the Government undertakings was for the production of ammonium nitrate and nitroguanidine at Welland, Ont., in a works which was operated by the Welland Chemical Works, Limited. It came into production early in 1941 and has since been taken over by the North American Cyanamid, Limited.

In addition to the above, mention might be made of the projects to produce cumene, alkylates and other such ingredients of high octane gasolines, and still other expansions to meet the increased demands for basic lines such as carbide, phosphorus, acetylene black, ethyl alcohol, toluol, glycerine and others.

According to records of the Department of Munitions and Supply, the output of military explosives and special chemicals, to the end of 1944, reached a total of 1,500,000 tons.

The major divisions of the heavy chemical industry are treated separately under the following headings:

Alkalies.—The alkalies division of the industry is based upon the vast salt deposits which underlie the Windsor-Sarnia district in southwestern Ontario. The salt is brought to surface as brine of which about one-half is evaporated to produce ordinary salt for commercial and table use, the other half is used for chemical purposes.

At Windsor, Ont., the Canadian Industries, Limited, treats brine electrolytically to produce caustic soda and liquid chlorine. Built in 1912 and operated continuously since that date, this works in 1930 added an extension to utilize the hydrogen (which formerly went to waste) in the manufacture of ammonia, this being the first synthetic unit of its kind in Canada. Other lines have been added from time to time, including hydrochloric acid, chloride of lime, ferric chloride, sulphur monochloride, sulphur dichloride and sodium hypochlorite.

To meet the demand of the expanding pulp, rayon and cellophane industries of Eastern Canada, the Canadian Industries, Limited, in 1934, erected a new caustic-chlorine plant at Cornwall, Ont., and, in 1938, opened another unit at Shawinigan Falls, Que. For these projects most of the salt is brought from Windsor, the raw material in this instance being transported to the source of cheap power and to the principal markets for the finished products.

Another important plant which uses salt brine as its chief material is operated by Brunner-Mond Canada, Limited, at Amherstburg, Ont. Built in 1919, it is the only producer of soda ash in Canada and also, since 1934, of calcium chloride which is recovered as a secondary product in the Solvay process.

While these alkali producers were working to capacity in June, 1948, and in some instances had extended their facilities considerably since the start of the Second World War, there were still substantial imports under these headings in 1947 amounting to 28,899 tons at \$740,074 for caustic soda and 4,390 tons at \$184,398 or soda ash.

In late 1946, there were three caustic-chlorine plants under construction, one by the Dow Chemical Company of Canada, Limited, Sarnia, Ont., one by the Dominion Alkali Chemicals, Limited, Beauharnois, Que., and one by the Aluminum Company of Canada, Limited, Arvida, Que.

Acids.—In the acids division of the industry, Canada has long been self-sufficient in regard to inorganic acids, but has been very largely dependent on foreign sources for her supply of organic acids. The manufacture of sulphuric acid was started at London, Ont., in 1867, and the next commercial unit was built at Capelton, Que., at which location there was a considerable supply of pyrites from nearby mines. Built in 1885, this latter plant operated steadily until 1925 when it was dismantled. The first unit using the contact process was built in 1908 at Sulphide, Ont., with pyrites as the chief source of sulphur, and the first plant to utilize smelter gases was built at Coniston, Ont., in 1925. Three new plants were built after the outbreak of the Second World War to make ten producers in all, as follows: the Canadian Industries, Limited, at Copper Cliff, Ont., Hamilton, Ont., and New Westminster, B.C.; the Consolidated Mining and Smelting Company of Canada, Limited, at Trail, B.C.; the Nichols Chemical Company, Limited, at Sulphide, Ont., Valleyfield, Que., and Barnet, B.C.; the North American Cyanamid, Limited, at Welland, Ont.; the Aluminum Company of Canada, Limited, at Arvida, Que.; and the Dominion Steel and Coal Corporation, Limited, at Sydney, N.S. Output of sulphuric acid in 1947 totalled 717,830 tons (66° Be) compared with the highest pre-war tonnage of 282,716 of the same density in 1937.

The successful recovery of sulphuric acid from smelter gases has been one of the outstanding developments of the industry. Previously the raw materials for its manufacture were either sulphur or sulphur-bearing ores and with the exhaustion of the latter more dependence was placed on elemental sulphur imported chiefly from Texas, U.S.A. In search of a cheaper source of sulphur, attention was turned to the sulphur gases which belched from the stacks of Canada's huge metal smelters. In 1925, a trial plant was built by Canadian Industries, Limited, at Coniston, Ont., in connection with the nickel smelter at that point, and it proved highly successful. In 1929, this Company established a larger and permanent unit at the smelter of the International Nickel Company, Limited, at Copper Cliff, Ont.

Even more striking were the developments at Trail, B.C., arising out of the utilization of the gases from the lead-zinc smelter of the Consolidated Mining and Smelting Company of Canada, Limited. For some time this Company had been faced with claims for damage to crops on nearby lands from the sulphur-bearing gases, and the problem assumed international proportions when complaints came from across the International Boundary. This condition of affairs and the desire to eliminate waste led to an extensive program of research which culminated in the building of one of the largest chemical plants in the country. It was decided to

use the waste gases to make sulphuric acid, which in turn could be used to make ammonium sulphate for fertilizer purposes. There is now at Trail, B.C., the largest acid plant in Canada, a huge synthetic ammonia plant, an ammonium sulphate plant, an ammonium nitrate plant, a phosphoric acid plant and an ammonium phosphate plant. The final products are the nitrogen-bearing fertilizers, ammonium sulphate, ammonium nitrate and ammonium phosphate, which are chiefly for export. In 1934, a process was developed to produce elemental sulphur, but in late years this unit has not been in operation as all sulphur in the smelter gases is required for fertilizers.

The principal users of nitric acid in Canada, the explosives and ammonium nitrate industries, make their own requirements: Works for this purpose are in use by North American Cyanamid, Limited, at Welland, Ont., the Consolidated Mining and Smelting Company of Canada, Limited, at Trail, B.C., and at Calgary, Alta., and the Canadian Industries, Limited, at McMasterville, Que., Nobel, Ont., and James Island, B.C. Some of these concerns also make acid for sale to industrial users, as does the Nichols Chemical Company, Limited, at Sulphide, Ont. A very large part of the production facilities have been erected since the outbreak of the Second World War and it is estimated that the total output for all purposes amounted to 256,000 tons (42° Be) in 1946.

Muriatic or hydrochloric acid is made by Canadian Industries, Limited, at Hamilton, Windsor, and Cornwall, all in Ontario; cresylic acid is made by the Dominion Tar and Chemical Company, Limited, at Toronto, Ont.; hydrofluosilicic acid is made by the Consolidated Mining and Smelting Company of Canada, Limited, at Trail, B.C.; phosphoric acid is made by the latter Company as an intermediate in making phosphate fertilizers and also by the Electric Reduction Company of Canada, Limited, at Buckingham, Que.; stearic acid is made by the W. C. Hardesty Company of Canada, Limited, at Toronto, Ont., and the S. F. Lawrason and Company, Limited, at London, Ont.; naphthenic acid is made by Imperial Oil, Limited, at Montreal, Que.; oleic acid by S. F. Lawrason and Company, Limited; and fatty acids by the last-mentioned concern and by the Woburn Chemicals, Limited, at Toronto, and the W. C. Hardesty Company of Canada, Limited, at Toronto.

Glacial acetic acid is made by the Shawinigan Chemicals, Limited, at Shawinigan Falls, Que., which is one of the great chemical plants of the British Commonwealth. As early as 1903, the power developments at this point had attracted a carbide plant which has continued to operate ever since and which, during the First World War, was greatly expanded. The Allies were then in urgent need of acetone for T.N.T. and later for acetic acid for the manufacture of cellulose acetate, an essential compound for the treatment of aeroplane wings. A process was worked out by Canadian chemists by which these chemicals could be made synthetically from calcium carbide and, in 1916, at the request of the Imperial Government, the capacity of the carbide furnaces was enlarged and a large chemical plant was erected. At the close of the First World War the demand for acetone ceased and the Company soon discontinued its manufacture, but improvements in its process for making acetic acid and an increasing demand enabled the Company to expand its output and ship to markets in all parts of the world. Continuous research has led to the commercial production at this plant of many acetylene derivatives, and it is interesting to note that the Company started to make acetone again in 1936 by an entirely new process. In normal times Shawinigan Chemicals, Limited, is a large exporter, particularly of carbide, acetic acid, acetylene black and vinyl resins.

In 1947, Canada's export of acids amounted to \$3,712,611 chiefly acetic and sulphuric. Imports were valued at \$3,510,121 with tartaric, acetic, citric, salicylic, boracic and stearic as the principal items.

Cyanamide, Cyanide and Carbide.—The first Canadian works to make calcium carbide was erected at Merritton, Ont., in 1897, electricity being obtained from power stations on the nearby Welland Canal. Later a plant was erected at Ottawa, and in 1903 the Shawinigan Carbide Company completed its furnaces at Shawinigan Falls, Que., to utilize the newly developed power at that point. About 1912, these three companies amalgamated to form the Canada Carbide Company, and the units at Merritton and Ottawa were later dismantled. In 1927, the Canada Carbide Company and the Canadian Electro Products Company, Limited, were consolidated into the Shawinigan Chemicals, Limited. The capacity of this works was expanded considerably during the Second World War.

Another carbide plant is operated at Welland, Ont., by the Electro Metallurgical Company of Canada, Limited. This Company and the Shawinigan Chemicals, Limited, are the only concerns making carbide for sale.

At Niagara Falls, Ont., the North American Cyanamid, Limited, operates a huge cyanamide works, probably the largest of its kind in the world. Started in 1909 with an initial capacity of 5,000 tons annually, the subsequent additions and improvements had brought the pre-war capacity to 355,000 tons. This tremendous tonnage was secured through the operation of what was, at that time, the largest lime-burning plant in the world, the largest carbide furnaces and the largest liquid air plant for the preparation of pure nitrogen. The calcium cyanamide, which is made by absorbing nitrogen in calcium carbide at white heat, is used as a fertilizer and a large part of the production is exported. Quite a large proportion of the output, however, is used by the Company to make cyanide for use by the Canadian mining industry or for export, also as a material for certain war chemicals. Sodium silicate has been produced in this works since 1932.

Ammonia.—Ammonia and its compounds were in heavy demand for war uses and facilities for increased capacity involved major expenditures in the war years. At the outbreak of the Second World War synthetic ammonia was being made at Trail, B.C., for use in nitrogen fertilizers, and at Windsor, Ont., for use mainly for the manufacture of blasting explosives; aqua ammonia and anhydrous ammonia were recovered from gas liquor by Canadian Industries, Limited, in a plant at Toronto, Ont. War requirements brought expansion to the original Trail, B.C., facilities as well as a new Government-owned unit at that point, a new plant at Calgary, Alta., operated by Alberta Nitrogen Products, Limited, on behalf of the Government, and a new works near Welland, Ont., also built for the Government but operated by the Welland Chemicals, Limited. The Calgary works is unique in that it uses natural gas as its primary material; at Welland, the coke process is used. All of these works made anhydrous ammonia and ammonium nitrate. In 1943, when war demands slackened and a shortage of fertilizer developed in the United States and Canada, steps were taken to utilize the excess ammonium nitrate capacity to provide a material suitable for fertilizer. This was made possible by a research program which resulted in the making of a prilled or pebbled form of ammonium nitrate properly conditioned to render it free flowing when used. Practically all of the output is now marketed in this form, chiefly for export to the United States to ease the fertilizer situation in that country.

The Calgary works has now been taken over by the Consolidated Mining and Smelting Company of Canada, Limited, and the Welland Works has been purchased by the North American Cyanamid, Limited.

Organic Chemicals.—In the manufacture of organic chemicals there has been outstanding progress in recent years. Mention has been made already of the Shawinigan Chemicals, Limited, which is the leading company in this field, and is concerned mostly with products based on acetylene, including butyl acetate, ethyl acetate, acetone, acetylene black, acetic anhydride, acetaldehyde, croton aldehyde, pentasol acetate, vinyl acetate, vinyl resins, dibutyl phthalate and butyl alcohol. Chloral crotonic acid and monochloroacetic acid are post-war additions to the lines made by this company.

The principal producer of coal tar derivatives is the Dominion Tar and Chemical Company, Limited, Toronto, Ont., which makes cresylic acid, phenol, cresol, ortho cresol, para cresol, xylenols and naphthalene. Several coke-oven operators recover xylol, toluol and benzol; a number of explosives plants make dinitrotoluol, nitroglycerine and trinitrotoluene; the Standard Chemicals, Limited, Montreal, Que., and the Canadian Industrial Alcohol Company at Lindsay, Ont., recover methyl alcohol, and acetone by the destructive distillation of hardwoods; perchlorethylene and trichlorethylene are made at Shawinigan Falls, Que., by the Canadian Industries, Limited, and by Defence Industries, Limited. In 1941 the Naugatuck Chemicals, Limited, Elmira, Ont., started to make aniline oil, diphenylamine and certain accelerators and plasticizers for the rubber and plastics industries. Acetanilide, nitrobenzole and D.D.T. have since been added to its products.

The manufacture of styrene and butadiene for synthetic rubber began in late 1943, at the huge works of the Polymer Corporation, Limited, at Sarnia, Ont., and cumene, butane and propane are recovered from refineries in Sarnia, Ont., Montreal, Que., and Calgary, Alta. Industrial alcohol is made by a number of liquor distilleries and in 1943 the Ontario Paper Company, Limited, at Thorold, Ont., began to make ethyl alcohol from sulphite liquor obtained from the paper mill at that point. Late in 1947 work was started on a large plant at Gatineau, Que., to make alcohol from the sulphite liquor from the paper mill at that point.

Phosphorus Compounds.—Phosphorus, phosphate chemicals and chlorates are produced by the Electric Reduction Company of Canada, Limited, at Buckingham, Que., which is the sole producer of these items in this country. Established in 1897 to utilize the phosphate ores in the vicinity, this plant has been operating mainly on imported rock in late years. Phosphorus and phosphoric acid were the main products for most of this period, but in the past decade the Company has developed a very diversified line of chemicals including monosodium phosphate, disodium phosphate, trisodium phosphate, anhydrous tetrasodium phosphate, calcium phosphide, acid calcium phosphate and sodium acid pyrophosphate, also barium chlorate, ammonium chlorate, sodium perchlorate, potassium chlorate and potassium perchlorate. Both amorphous and yellow phosphorus are made in this works.

Superphosphates for fertilizers are made by Canadian Industries, Limited, at McMasterville, Que., Hamilton, Ont., and New Westminster, B.C., and by the Consolidated Mining and Smelting Company of Canada, Limited, at Trail, B.C. The latter concern also makes ammonium phosphate fertilizers.

Compressed Gases.—The tremendous wartime demand for acetylene and oxygen for welding purposes in the shipbuilding, aircraft, and munitions industries was met by the building of new plants and expansion of existing facilities. The production of acetylene in 1946 at 100,276,367 cu. ft. and of oxygen at 476,822,719 cu. ft. was 106 p.c. and 152 p.c., respectively, above the quantities made in 1939.

Most of the concerns in the industry operate several establishments located strategically across the country. The Canadian Liquid Air Company, Limited, makes acetylene, oxygen and nitrogen in 11 plants; the Dominion Oxygen Company, Limited, makes oxygen at five locations; the Prest-O-Lite Company of Canada, Limited, makes acetylene in four establishments; the Wall Chemicals Canadian Corporation, Limited, makes acetylene and oxygen, each in two separate works, and the Liquid Carbonic Canadian Corporation, Limited, makes carbon dioxide at six different points. Other operators include the Peoples Gas Supply Company, Limited, making acetylene at Ottawa, Ont.; the B.C. Welding Sales and Equipment Company, Limited, making hydrogen and oxygen at Armstrong, B.C.; the Oxygen Company of Canada, Limited, making nitrous oxide, at Toronto, Ont., and at Montreal, Que.; the Swift Canadian Company, Limited, Lever Brothers, Limited, and the Canada Packers, Limited, all of Toronto, Ont., and the Proctor and Gamble Company of Canada, Limited, of Hamilton, Ont., making hydrogen for use in hydrogenative oils for soap-making.

Miscellaneous Heavy Chemicals.—The above details refer to the main aspects of Canada's chemical manufacturing industry. To complete the list, mention should be made of certain items which do not fall under the particular features that have been treated separately, such as cobalt salts and white arsenic made by the Deloro Smelting and Refining Company, Limited, at Deloro, Ont.; litharge and red lead by the Carter White Lead Company of Canada, Limited, at Montreal, Que.; zinc oxide by the Zinc Oxide Company of Canada, Limited, at Montreal, the Durham Chemical Company (Canada), Limited, at Cap de la Madeleine, Que., and by the Watts Chemical Company at Toronto, Ont.; metallic naphthenates by the Nuodex Products of Canada, Limited, at Toronto, Ont.; metallic stearates by H. L. Blachford at Montreal, Que.; carbon bisulphide by the Cornwall Chemicals, Limited, at Cornwall, Ont.; sodium silicate by the National Silicates, Limited, at Toronto, Ont.; liquid hydrogen peroxide and trichlorethylene by Canadian Industries, Limited, at Shawinigan Falls, Que.; copper sulphate by Canadian Refineries, Limited, at Montreal East, Que.; vanillin by the Howard Smith Chemicals, Limited, at Cornwall, Ont.; fine chemicals by the Merck and Company, Limited, and the Mallinckrodt Chemical Works, Limited, at Montreal, Que.; and ammonium chloride, salt cake, sodium sulphite, zinc chloride, sodium metabisulphite, liquid sulphur dioxide and sodium thiosulphate by Canadian Industries, Limited, at Hamilton, Ont.; ethylene glycol by the Dow Chemical Company of Canada, Limited, at Sarnia, Ont.; aluminum sulphate by the Aluminum Company of Canada, Limited, at Arvida, Que., and by the Nichols Chemical Company, Limited, at Valleyfield, Que.

The heavy chemical industry, as it is defined for statistical purposes and for which figures are given on p. 549, includes only the plants which were occupied chiefly in this line of manufacture. Only 37 establishments were placed in this category in 1944 but there were other works, such as coke plants, metal refineries and explosives divisions which produced chemicals only as a secondary or minor part of their operations, and still other works, such as alcohol distilleries and coal

tar distilleries which have been given a separate industry classification. From data assembled from all sources, it is estimated that the factory value of all chemicals made for sale was approximately \$110,000,000 in 1946. On a similar basis, the imports were computed at \$35,000,000 and exports at \$55,000,000.

The Allied Chemical Industries Group

All industries in the allied chemical products division recorded big gains during the war years. Fertilizers, medicinals, toilet preparations, polishes and adhesives output values in 1944 were about double those reported for 1939, and gains of about 50 p.c. were recorded for soaps, inks, paints and coal tar distillation. Each of the above industries, with the exception of the coal tar distillation industry, in which production declined approximately 3 p.c., recorded further increases in production in 1946; the first group increased by about 31 p.c. and the second approximately 16 p.c. The miscellaneous industry, which includes explosives and ammunition, with a production increase from \$25,800,000 in 1939 to \$431,500,000 in 1944 recorded the greatest gains during the war years, but with the cessation of hostilities, this industry suffered most and production declined to \$59,000,000 by 1946.

Coal Tar Distillation.—There was no change in the operating coal tar distillation units in 1944 but production at \$5,697,144 was 13 p.c. below the corresponding figure for 1943. By 1946 production had declined further to \$5,509,727. Only 4 concerns operate in this industry.

Production of creosote and heavy oils totalled about 10,200,000 gal. in 1946, compared with 10,500,000 gal. in 1944; pitch production approximately 85,000 tons, compared with 86,000 tons in 1944 and refined tars about 5,000,000 gal. compared with 7,000,000 gal. in 1944. Imports in 1946, with corresponding 1944 figures in parentheses, included 3,271,874 (1,918,244) gal. of crude coal tar valued at \$256,334 (\$138,384) and 1,922 (6,258) tons of pitch at \$43,311 (\$118,080), and 231,054 (182,146) gal. of carbolic or heavy oils at \$59,395 (\$38,547). Exports of coal tar and pitch totalled 2,209,450 (288,698) gal. at \$193,702 (\$43,654) and of creosote oils, 86,534 (2,595,689) gal. at \$16,262 (\$437,671).

Hardwood Distillation.—In the hardwood distillation industry there were only 5 operating plants in 1944, 3 units for distilling only, 1 for refining only and 1 for both distilling and refining. The latter was operated by the Canadian Industrial Alcohol Company, Limited, at Lindsay, Ont., and the others by the Standard Chemical Company, Limited, at Fassett, Que., Donald, Ont., South River, Ont., and the refinery at Montreal, Que. By 1946, Standard Chemical Company, Limited, reported production at their South River and Montreal plants only. However, Western Wood Products, Limited, at Red Deer, Alta., reported commencement of operations producing charcoal and crude methyl hydrate, bringing the number of operating units to four. Production at \$999,790 during 1946, represents a decline of about 34 p.c. from the 1944 total of \$1,528,022 and included 217,547 gal. of refined wood alcohol at \$253,676, 19,127 tons of charcoal at \$512,838, and 2,380 tons of grey acetate of lime at \$81,704 as well as acetone, etc.

It is estimated that 6,300 tons of charcoal were made in 1946 in ordinary wood-burning installations, mostly in the Province of Quebec, bringing the total for Canada to approximately 25,000 tons. Corresponding figures for 1944 were 21,000 tons and 50,000 tons.

Paints and Pigments.—Production of paints and pigments in 1946 amounted to \$56,729,620, an increase of nearly 16 p.c. over the corresponding figure for 1944 and about 120 p.c. over the 1939 production of \$25,855,506. The 98 factories classified in this industry in 1946, employed an average of 5,006 workers throughout the year. The main items of production were as follows: mixed paints, 9,700,000 gal. valued at \$25,100,000; enamels, 3,800,000 gal. at \$12,000,000; lacquers, 1,600,000 gal. at \$4,300,000; and varnishes, 3,400,000 gal. at \$7,000,000.

Imports in this category were valued at \$9,400,000 in 1946, including the following as the more important items: lithopone 8,900 tons at \$878,781; black carbon, 20,733 tons at \$2,035,151; titanium oxide and antimony oxide, 11,900 tons at \$2,200,000; zinc oxide, 925 tons at \$151,000; ultramarine blue, 304 tons at \$111,000; ochres and siennas, 1,436 tons at \$82,000; varnishes, lacquers, etc., 175,000 gal. at \$446,000. Exports were worth \$4,407,000 in 1946.

Medicinals and Toilet Preparations.—In 1946, there was a 20 p.c. gain in output by the 201 firms in the medicinals and pharmaceuticals industry over the 1944 production and an increase of 146 p.c. over the corresponding figure for 1939. Total value at factory prices in 1946 was \$67,049,834. Establishments in this line of manufacture employed an average of 7,670 workers and paid out \$12,832,173 for salaries and wages and \$23,163,222 for manufacturing materials. The value of standard pharmacopoeil items approximate \$10,600,000; patent medicines, \$9,400,000; specialties with ingredients declared, \$16,200,000; vitamin and vitamin products, \$8,000,000; penicillin, \$6,000,000; and biological preparations, \$2,200,000. Secondary products, such as cosmetics, flavourings, etc., made up the remainder of the output. Imports amounted to approximately \$9,370,000 while exports totalled about \$5,340,000.

A recent highlight is the manufacture of penicillin, which is now being made by Merck & Company, Limited, and Ayerst, McKenna and Harrison, Limited, both of Montreal, Que., and by the Connaught Laboratories at Toronto, Ont.

The toilet preparations industry showed production at \$20,117,113 in 1946, this being 13 p.c. higher than in 1944 and 191 p.c. over the \$6,918,573 reported value of production in 1939. There were 91 plants in this group in 1946 with 1,995 employees, the amount of \$2,729,367 was paid in salaries and wages and \$7,622,735 for materials. Imports in 1946 were appraised at \$720,645 and exports at \$804,540.

The production figures quoted above are based on factory selling values and do not, of course, represent the amounts actually spent by Canadians on these items. Annual records of retail sales are not available on a commodity basis; it is known, however, from the Census of Merchandising for 1941 that the value of toilet preparations at retail approximated \$22,000,000 in that year, and of medicines, drugs, etc., \$48,000,000.

Soaps and Cleaning Preparations.—The soaps, washing compounds and cleaning preparations industry in 1946 included 150 establishments, 49 in the soaps division, 56 in the washing compounds section, and 45 others occupied chiefly in making scouring powders, drain cleaner, hand cleaner and other cleaning preparations for household or industrial use. Output of these preparations was valued at \$38,274,818 or 16 p.c. over that of 1944.

Production of soaps of all kinds in 1946 totalled 109,660 tons valued at \$25,064,397 at factory prices, including 24,021 tons of bar laundry soap; 21,930 tons of chips and flakes; 40,308 tons of soap powders; 16,312 tons of bar toilet soap;

468 tons of shaving soap and cream; 1,805 tons of textile and mill soap; 2,683 tons of liquid soap, and 1,243 tons of soft soap. In addition to these approximately 6,136 tons of soaps were made as minor products by firms classified to other industries.

Imports valued at \$962,469 in 1946 included castile soap, 3,245 lb. at \$1,112; laundry soap 6,065,092 lb. at \$538,637; soap powder and flakes, 745,492 lb. at \$108,476; liquid soap 358,808 lb. at \$55,017; bar toilet soap worth \$171,925 and other soap, \$87,302. Exports in 1946 amounted to \$2,103,382, including 2,398,995 lb. of toilet soap at \$485,855 and 17,503,826 lb. of other soap worth \$1,617,527.

Fertilizers.—There was a substantial increase in the use of fertilizers in Canada with sales for the year ended June 30, 1946, amounting to 632,943 tons compared with 535,108 tons in 1944, an increase of about 18 p.c. The greatest tonnage used in pre-war years was 334,003 tons for the year ended June 30, 1939. Higher sales were recorded in each province in 1946; in Prince Edward Island the gain over 1944 was 32 p.c. to 56,725 tons; in Nova Scotia 4 p.c. to 43,068 tons; in New Brunswick 15 p.c. to 83,430 tons; in Quebec 2 p.c. to 151,308 tons; in Ontario 23 p.c. to 237,080 tons; in the Prairie Provinces 121 p.c. to 31,202 tons; and in British Columbia 31 p.c. to 30,130 tons.

Fertilizer-mixtures amounting to 542,497 tons accounted for 84 p.c. of all sales. The principal mixes were the 2-12-6 with 165,451 tons and the 4-8-10 with 143,436 tons, the former being used in greater amounts in Ontario and Quebec and the latter in the Maritimes. The total tonnage of fertilizers contained 26,403 tons of nitrogen, 81,025 tons of phosphoric acid and 45,520 tons of potash.

The increased demand, both at home and in the export markets, was reflected in the fertilizer manufacturing industry in Canada as production rose in 1946 to \$50,000,000 compared with \$31,000,000 in 1944 and \$13,000,000 in 1939. The ammonium nitrate for fertilizer purposes, ammonium sulphate from coke plants and cyanamide are not included in these figures as the firms which produce these latter items have been classed in other industries. The total output of mixed fertilizers was shown as 597,855 tons worth \$17,956,075 in the calendar year 1946.

Explosives, Ammunition and Pyrotechnics.—As was to be expected, this chemical sub-group was most affected by the outbreak of war. Through the creation of new units and the expansion of existing plants, production rose from \$13,000,000 in 1939 to a peak of \$454,000,000 by 1943 and the number of plants classified to this industry increased from 10 to 27. Because of major changes in the character of military requirements and to an easier demand in the earlier part of the following year, the output value of explosives and ammunition fell off about 13 p.c. to \$391,000,000. With the cessation of hostilities, many of these plants were either closed down or adapted to peacetime pursuits with the result that, by 1946, only 8 plants remained under this classification and production fell to \$12,000,000.

Other Allied Chemical Industries.—Production from the inks industry increased 37 p.c. between 1939 and 1944 rising from \$3,454,951 to \$4,740,061 in that period. The continued post-war expansion of this industry may be seen from the fact that, by 1946, value of production had increased to \$6,244,648 with printing inks totalling 15,891,841 lb. valued at \$5,221,622; writing inks at 949,260 lb. were valued at \$310,230. Printers' rollers and certain secondary products, such as mucilage and paste, made up the remainder of the output from the 30 establishments in this group. Imports of printing inks amounted to 692,844 lb. at \$363,085; writing inks to \$40,360.

The adhesives industry with 22 operating plants showed production in 1946 at \$6,784,313 or 21 p.c. above the \$5,626,892 reported by the 24 plants operating in 1944 and 221 p.c. above the \$2,110,806 reported in 1939. Output of bone and hide glue amounted to 5,224,629 lb. valued at \$1,081,705. Vegetable glues, synthetic resin glues and linoleum cement were the other principal products.

Polishes and prepared waxes were made in greater volume in 1946, the value for the industry at \$9,558,330 being 30 p.c. greater than in 1944 which, in turn, was 113 p.c. above the 1939 total of \$3,461,556.

In the miscellaneous industry, excluding explosives and ammunition, there were 254 establishments making such items as insecticides, plastics, sulphonated oils, matches, etc. Output from these products in 1946, amounted to \$47,665,000 compared with \$40,569,000 in 1944 and \$12,402,000 in 1939.

The Chemical Process Industries

The chemical process industries include those industries which, because of the nature of their products, are classified by the Bureau of Statistics with industrial groups other than the chemical industry. However, chemical processes enter into the manufacture of these products to such an extent that they may be considered as playing a major part in chemical production. These chemical process industries include some of the most important industries in the country. The manufacture of pulp and paper, rubber and rubber goods, glass, artificial abrasives, non-ferrous metal smelting and refining, breweries and distilleries, sugar refineries, leather tanneries, coke and gas plants and petroleum refineries are in this group. Output from these industries in 1946 exceeded \$1,600,000,000 in value, and employment was provided for 125,000 workers.

In 1946, the production of newsprint at 4,162,158 tons compared with 3,039,783 tons in 1944 and 2,926,597 tons in 1939 was 42 p.c. above the production in 1939; coke output at 3,363,109 tons was 20 p.c. below the 4,193,424 tons produced in 1944 but nearly 40 p.c. above the 2,410,095 tons produced in 1939. Gasoline sales at 1,144,000,000 gal. exceeded the billion-gallon mark for the first time. Production of refined copper at 167,221 tons was down 33 p.c. from the 250,214 tons reported in 1944 but refined lead at 165,745 tons was up 17 p.c. over the 1944 total of 143,757 tons and refined zinc at 185,683 tons was greater by 9 p.c. than the 1944 total of 169,684 tons. Aluminum ingots production suffered the greatest decline of the metals under review, production having dropped from 460,686 tons in 1944 to 194,117 tons in 1946. Crude artificial abrasives amounting to 169,176 tons showed a decline of about 20 p.c.

Including the process industries and the chemicals and allied products industries, the gross production of these industries in 1946 totalled \$2,050,000,000 compared with \$2,300,000,000 in 1943, the record year, and \$998,500,000 in 1939.

It appears that the chemical industries have emerged from the Second World War in a slightly better position than industry as a whole. The official index of the physical volume of business for all manufactures in Canada, as compiled by the Dominion Bureau of Statistics, averaged 188.4 in 1946, calculated on a base of 1935-39 equal to 100. This indicates a gain of 88 p.c. for industry in general compared with 100 p.c. for the chemical group.

In addition to the industries mentioned above, there are a number of related sub-groups which utilize chemical engineering principles or operate under chemical control. These are as follows:—

Artificial Abrasives.—The manufacture of artificial abrasives in Canada began about fifty years ago. The discovery of silicon carbide is generally credited to Dr. A. E. Acheson, who built the first commercial plant at Niagara Falls, New York, U.S.A., in 1895 and a little later erected a subsidiary works at Niagara Falls, Ont. Fused alumina was first produced commercially as an abrasive in 1901 by the Norton Company in Niagara Falls, New York, U.S.A.

Most of the North American output of crude artificial abrasives comes from Canadian plants, and most of this production is shipped to parent companies in the United States for crushing, cleaning and grading. Five concerns in Canada now operate 6 large works for the manufacture of these products, as follows: Simonds Canada Abrasive Company, Limited, Arvida, Que.; Canadian Carborundum Company, Limited, Shawinigan Falls, Que., and Niagara Falls, Ont.; Exolon Company, Thorold, Ont.; Lionite Abrasives, Limited, Niagara Falls, Ont.; Norton Company, Chippawa, Ont.

Output in 1946 included 49,953 tons of silicon carbide, 119,223 tons of fused alumina, and other products, such as boron carbide, calcium boride, fused magnesia, etc.

Glass.—Four companies now operate 7 glass factories across Canada. Bottles, jars, etc., are made by the Consumers Glass Company, Limited, Montreal, Que.; and by the Dominion Glass Company, Limited, with works at Montreal; Hamilton, Ont.; Wallaceburg, Ont.; and Redcliff, Alta. Pyrex brand ovenware is made by Corning Glass Works of Canada, Limited, at Leaside, Ont. Window glass is made by the Industrial Glass Works Company, Limited, at Montreal. This latter works, which is the only one of its kind in Canada, came into production in May, 1941, was destroyed by fire in June, 1944, but resumed operations in the autumn of 1946.

Output of pressed, blown and drawn glass of all kinds was valued at \$17,500,000 in 1946. Imports of window glass in that year totalled 43,700,000 square feet valued at \$2,700,000.

In 1946 about 5,921 persons were employed by the Canadian glass industry.

Pulp and Paper.—Paper manufacturing began in Canada early in the last century. The first mill in Lower Canada was established at St. Andrews, Que., near Lachute, in 1803, and the second in the county of Portneuf, Que., in 1810. The Maritime Provinces entered the industry in 1819 with a mill built a little distance from Bedford Basin, near Halifax, N.S. The first mill in Upper Canada was located at Crooks Hollow (now Greenville), Ont., near Hamilton, but the date is uncertain, being set by some at 1813 and by others at 1820 and 1825.

Until Confederation, the industry was confined to the manufacture of paper from rags, but in 1866 Alexander Buntin began to make wood-pulp at Valleyfield, Que., in what is claimed to have been the first wood grinder in America. In 1887, Charles Riordon installed Canada's first sulphite mill at Merritton, Ont., and in 1907 the Brompton Pulp and Paper Company, Limited, built at East Angus, Que., the first mill in North America to produce chemical pulp by the kraft or sulphate process.

In 1881, the output of the industry was worth about \$2,500,000; 40 years later it was \$151,000,000, and at the end of another 20 years, in 1941, it was \$334,700,000. In 1946, the last year for which figures are available, the total was \$527,800,000 and the 113 mills which were in operation employed 44,967 persons. Exports of newsprint alone in that year totalled 3,858,467 tons at \$265,800,000.

Coke and Gas.—The present capacity of Canada's coke plants is about 4,000,000 tons per year. By-product ovens are operated by the following concerns: Dominion Steel and Coal Corporation, Limited, Sydney, N.S.; Montreal Coke & Manufacturing Company, Montreal, Que.; Algoma Steel Corporation, Limited, Sault Ste. Marie, Ont.; Hamilton By-Product Coke Ovens, Limited, Hamilton, Ont.; Steel Company of Canada, Limited, Hamilton, Ont.; Public Utilities Commission, Owen Sound, Ont.; Winnipeg Electric Company, Winnipeg, Man.; the British Columbia Electric Power and Gas Company, Limited, Vancouver, B.C., and the Crow's Nest Pass Coal Company, Limited, Michel, B.C. The latter Company also operates beehive ovens as does the International Coal and Coke Company, Limited, Coleman, Alta. Retort and water gas plants are operated in 17 different cities or towns.

Production from the coke and gas industry (30 plants employing 4,961 workers) was valued at \$63,000,000 in 1946. Coke production totalled 3,451,000 tons.

Sugar, Starch and Glucose.—The refining of sugar is one of Canada's oldest industries, the Census of 1870 showing 4 establishments in this industry with 360 employees and output worth \$4,000,000. In 1946 there were 11 refineries with 2,600 employees and production at \$61,000,000. The following concerns have cane sugar refineries: Acadia Sugar Refining Company, Limited, Dartmouth, N.S.; Atlantic Sugar Refineries, Limited, Saint John, N.B.; Canada and Dominion Sugar Company, Limited, at Montreal, Que., and Chatham, Ont.; St. Lawrence Sugar Refineries, Limited, Montreal, Que., and the British Columbia Sugar Refining Company, Limited, Vancouver, B.C. Beet sugar plants are operated by the Quebec Sugar Refinery, St. Hilaire, Que.; Canada and Dominion Sugar Company, Limited, Wallaceburg, Ont.; the Manitoba Sugar Company, Limited, Winnipeg, Man., and the Canadian Sugar Factories, Limited, at Raymond and Picture Butte in Alberta. Output in 1946 included 377,000 tons of refined cane sugar and 103,000 tons of refined beet sugar.

At present there are only two concerns in Canada making corn starch, the Canada Starch Company, Limited, Cardinal, Ont., and the St. Lawrence Starch Company, Limited, Port Credit, Ont. Glucose, corn syrup, corn oil, dextrines, and related items are also made in these works.

Potato starch is made in Prince Edward Island and New Brunswick, there being 2 operating plants in each province in 1946. Three plants in British Columbia made glucose from potatoes.

Petroleum Refining.—The early 1860's were years of great activity in the western Ontario oil fields. Canada's first real oil well had been drilled in 1862 by James Shaw, a photographer, and there soon followed a number of good strikes including one famous gusher of 7,000 bbl. daily. Prices were high and the industry thrived, but the prosperity was shortlived. Soon discoveries in Pennsylvania, U.S.A., forced prices down and cut off markets. The Canadian industry was paralyzed and many of the refiners that had set up plants in and about the oil fields were ruined. A few struggled on, operating intermittently, and in 1880, seven of them in the London and Petrolia districts consolidated their assets and equipment to form the Imperial Oil Company, Limited. This was the beginning of the present Imperial Oil Company, Limited, which is now one of the principal operators, with refineries at Halifax, Montreal, Sarnia, Regina, Ioco and Norman Wells. Other

major refining companies in the industry include the British American Oil Company, Limited, at Toronto, Clarkson, Moose Jaw and Calgary; McColl-Frontenac Oil Company, Limited, at Montreal and Toronto; the Canadian Oil Companies, Limited, at Petrolia; the Good Rich Refining Company, Limited, at Port Credit; the Shell Oil Company of Canada, Limited, at Montreal; the Standard Oil Company of British Columbia, Limited, at Burnaby, and the Shell Oil Company of British Columbia, Limited, at Vancouver. A dozen or so smaller refineries, mostly in the Western Provinces, complete the list.

The Census of 1901 records 14 oil refineries in operation and production at \$3,500,000. In 1946 there were 30 refineries with 7,048 employees and production at \$222,000,000. Total refinery capacity in 1946 totalled 246,000 bbl. of crude oil per day.

Pig Iron, Steel and Ferro-Alloys.—The iron and steel industry in Canada dates back more than two centuries to the establishment in 1736 of the first iron works, "Les Forges de St. Maurice", on the banks of the St. Maurice River in Quebec. This works was in continuous production until 1883 when it was abandoned. In 1787, steps were taken to develop the iron industry in Nova Scotia and there were iron furnace ventures in Ontario as early as 1800.

In 1946, Canada produced 1,406,000 net tons of pig iron and 2,327,000 net tons of steel ingots and castings. The three major corporations that constitute the core of the industry in Canada are self-contained in that they process iron and steel from the ore through to the semi-finished and finished articles. The activities of the Steel Company of Canada, Limited, cover a wide range of products. The main plant at Hamilton, Ont., has 3 blast furnaces, 13 open-hearths, 1 electric furnace and rolling mills for making billets, bars, wire rods, sheets, plates, strip and light shapes. Its capacity is about 1,100,000 net tons of ingots annually. The Algoma Steel Corporation, Limited, has 5 blast furnaces and 12 open-hearths, also rolling mills. Its capacity is about 736,000 tons of ingots, annually. The Dominion Steel and Coal Corporation operates 4 blast furnaces and 16 steel furnaces, with annual ingot capacity of 750,000 tons.

In addition to these larger concerns, there are 31 other steel makers which use electric or open-hearth furnaces to produce steel from pig iron and scrap. In all, there are 131 steel furnaces in Canada, including 49 open-hearth units, 79 electric units and 3 converters. At the beginning of the Second World War the rated capacity of steel furnaces was 2,300,000 net tons, but new installations raised this potential to 3,547,000 tons at the end of 1946, including 3,245,000 tons ingot capacity and 302,000 tons for castings. The capacity of iron blast furnaces at the end of 1946 was 2,744,000 net tons annually.

In the ferro-alloys industry, there are 3 main operators, as follows: the Electro-Metallurgical Company of Canada, Welland, Ont., makes manganese alloys, ferrosilicon and ferrochrome; the St. Lawrence Alloys and Metals, Limited, Beauharnois, Que., makes ferrosilicon, calciumsilicon, silicon metal and zirconium alloys; and the Chromium Mining and Smelting Corporation, Limited, Sault Ste. Marie, Ont., makes ferrosilicon, sil-x and chrom-x. In addition, ferrosilicon is recovered as a by-product by the makers of artificial abrasives; ferrophosphorus is made by the Electric Reduction Company of Canada, Limited, Buckingham, Que.; and spiegeleisen and silvery ferrosilicon are made by the Canadian Furnace, Limited, Port Colborne, Ont.

About 24,000 persons are employed in Canada's primary iron and steel industry.

Non-Ferrous Metal Smelting and Refining.—Amongst the countries of the world, Canada ranks first in the production of nickel and of platinum-group metals, second in gold and zinc, third in copper, and fourth in lead and silver.

The smelting and refining of non-ferrous ores is one of Canada's major industries, employing approximately 14,000 workers and distributing \$30,000,000 in salaries and wages each year. At Trail, B.C., there is one of the world's largest metallurgical works operated by the Consolidated Mining and Smelting Company of Canada, Limited. It produces refined lead and zinc, cadmium, bismuth, antimony, silver bullion and tin. At Flin Flon, Man., the Hudson Bay Mining and Smelting Company of Canada, Limited, produces refined zinc, cadmium and blister copper. Nickel smelters are operated by the Falconbridge Nickel Mines, Limited, Falconbridge, Ont., and the International Nickel Company of Canada, Limited, at Copper Cliff, Ont.; the former Company exports matte to Norway for refining, but the latter has a copper refinery at Coniston, Ont., and a nickel refinery at Port Colborne, Ont., and in addition to refined nickel and copper it recovers selenium, tellurium, platinum-bearing residues, nickel oxide, nickel salts, and gold and silver bullion. The Noranda Mines, Limited, Noranda, Que., treats the copper-bearing ores from northwestern Quebec; the Deloro Smelting and Refining Company, Limited, Deloro, Ont., produces cobalt metal and cobalt alloys; the Dominion Magnesium, Limited, Haley, Ont., makes magnesium metal and calcium metal; and the Canadian Copper Refiners, Limited, Montreal East, Que., recovers refined copper, selenium, tellurium, silver, gold and copper sulphate.

At Arvida, Que., the Aluminum Company of Canada, Limited, has one of the world's largest aluminum reduction works, and it also has units at Shawinigan Falls, Que. Radium salts and uranium salts are produced by the Eldorado Mining and Refining Company, Limited, Port Hope, Ont.

Distilleries and Breweries.—In 1946, there were 18 establishments engaged in the production of distilled liquors in Canada, 7 being in Quebec, 9 in Ontario and 2 in British Columbia. About 4,000 workers were employed in these plants and output was valued at \$67,000,000.

The exigencies of war had a profound effect on the distilling industry as practically all facilities were converted to the manufacture of industrial alcohol for use in the synthetic rubber and explosives programs. The output of ethyl alcohol jumped from 5,000,000 gal. of proof spirits in 1939 to 26,700,000 gal. in 1944 but dropped to 8,900,000 gal. in 1946.

In the brewing industry there were 61 establishments in operation in 1946 with 8,600 employees and production valued at \$109,000,000.

Rayon, Nylon and Synthetic Rubber.—Rayon yarn is made in Canada by Cortaulds (Canada), Limited, Cornwall, Ont., and both yarn and fabrics of artificial silk are produced by Canadian Celanese, Limited, at Drummondville, Que. Canadian Industries, Limited, Kingston, Ont., is the only maker of nylon yarns. Wood pulp and cotton pulp are the main raw materials of the first-mentioned concerns; imported nylon flake is used by the latter company.

The Polymer Corporation, Limited, Sarnia, Ont., turns out approximately 10,000,000 lb. of buna-S and butyl rubber each month. This plant, which employs about 1,800 people, is unique in that it not only makes both types of synthetic rubber but it also makes the principal components—butadiene and styrene for making buna-S, and isobutylene for making butyl rubber. It is located near the

Sarnia refinery of Imperial Oil, Limited, from which it draws its basic supply of petroleum gases. During the Second World War it also supplied large quantities of ethylbenzene and cumene for use in high octane gasolines. With its tremendous facilities it is a potential source of chemicals for Canadian industries, and, in fact, is now providing the styrene monomer for two large plants which have recently come into production on polystyrene plastics.

PRINCIPAL STATISTICS FOR THE MANUFACTURE OF CHEMICALS AND ALLIED PRODUCTS IN CANADA, BY INDUSTRIES, AND TOTALS FOR THE CHEMICAL PROCESS INDUSTRIES 1939, 1944 AND 1946

Subsection 1.—Manufactures Grouped by Chief Component Materials

A classification based on the chief component materials in the various products of each manufacturing establishment was applied for the first time in the compilation of the manufacturers returns for 1920. The number of groups was reduced from fifteen to nine to correspond with the external trade classification and the classes of industry were somewhat altered to conform with recent industrial developments. Subsequently, a number of minor changes were made, the most important being the elimination of central electric stations and the dyeing, cleaning and laundry industry from the compilation in 1936. Revisions due to these changes have been carried back to 1917 in so far as possible.

Trends in Manufacturing Production.—Table 8 shows the effects of the depression following 1929, the recovery since 1933, and the impact of the Second World War upon the main groups of industries with regard to the numbers employed, the salaries and wages paid, and the gross value of products. Owing to the price decline during the depression, money values of both wages and products were naturally affected more than the number of employees. Furthermore, during periods of curtailed production there is a tendency for wage-earners to be put on part time, while the number of salaried employees responds less quickly to reduction in output than that of wage-earners. Therefore, there are several reasons why the variation in number of employees should be less than that of money values. The figures of Table 8 are to be compared with those of Table 6, p. 531, which shows changes in volume of production. Compared with 1939, the number of employees in 1945 increased by 70.1 p.c. as compared with an increase of 55.5 p.c. in the physical volume of production; salaries and wages paid were 150.2 p.c. higher and the gross value of production 137.4 p.c. higher. Another significant change was the increase in the proportion of women engaged in manufacturing. Whereas in 1939, there were 281 females to every 1,000 males employed, by 1944 this figure had jumped to 403 and has since declined to 277 in 1945.

8.—Percentage Variation in Employment, Salaries and Wages, and Gross Value of Products in the Main Industrial Groups, Compared for Significant Years, 1929-45

NOTE.—The highest pre-depression year was 1929, while the lowest depression year was 1933.

Industrial Group	1933 Compared with 1929			1939 Compared with 1929			1945 Compared with 1939

Subsection 2.—Manufactures Classified on the Standard Classification Basis

During the war years a new Standard Classification of Manufactures was planned to meet the varying needs of different agencies and allow direct comparisons on different bases, see p. 550. The new Standard Classification then developed will, in future, replace the component material but for a limited number of years manufactures will be classified according to both systems to facilitate comparisons with earlier records. When the Standard Classification is considered to have become sufficiently established the component material classification will be discarded.

Since space is limited in the Year Book it has been decided to present the statistics in this and following editions on the new Standard Classification basis. The interested reader who, for purposes of comparison, wishes to tie in with the Component Classification of earlier Year Books, will find the data in the separate Manufactures Report which is built up round the Year Book presentation but includes many detailed statistical treatments that cannot be carried here.

Subsection 3.—Manufactures Classified by the Purpose of the Products

Significant changes have occurred since 1922 in the importance of the various groups shown in the purpose classification. On the basis of percentage to gross value of production, the most striking change is in the food group which showed a substantial decline from 28.2 p.c. of the total in 1922 to 22.6 p.c. in 1939 and 20.8 p.c. in 1945. The producer materials group, which took the lead from the food group in 1923, showed a steady increase up to 1939, since when it has remained at about 30 p.c. of the total. Due to the production of war equipment, vehicles and vessels increased from 7.7 p.c. in 1939 to 13.1 p.c. in 1945 and industrial equipment from 15.2 p.c. to 16.3 p.c. The other groups with the exception of "miscellaneous" showed slight declines during the war years.

10.—Principal Statistics of the Manufacturing Industries of Canada, Classified According to the Purpose of the Principal Product, by Main Groups, Significant Years 1929-45 and in Detail for 1945.

Table 11 has been included in order to give the amount and value of each of the principal commodities produced by the manufacturing industries of Canada. The list is not intended to be complete since a large number of commodities are produced in such small quantities that it would extend the table considerably without adding proportionately to its value to include them. The commodities listed, however, cover approximately 75 p.c. of total production.

Subsection 4.—Manufactures Classified by Origin of the Materials

The distinction made between farm materials of Canadian and foreign origin is based on whether the materials are indigenous to Canada rather than on their actual source. Thus, the industries included in the foreign origin classes are those depending upon materials that cannot be grown in Canada, such as tea, coffee, spices, cane sugar, rice, rubber, cotton, etc. Industries included in the Canadian origin classes may, however, be using large quantities of imported materials.

The mineral origin group includes, in addition to the non-ferrous metals, so largely produced in Canada, the manufactures of iron and steel, of petroleum, and of other mineral substances, the raw materials for which are very largely imported. Products of mineral origin, with the exception of fuels, are nearly all durable goods. A high standard of living and advanced industrial organization is usually indicated by a relatively large production and consumption of mineral products. During periods of depression when the production of capital goods is curtailed, employment in the industries of the farm group, which produce mainly consumer goods, exceeds that of the mineral group. The industries of the mineral group in 1943 had by far the greatest capital investment, employed the largest number of persons, and paid out the highest amount in salaries and wages. In 1943 the average capital per employee amounted to \$5,441 for the mineral group as compared with \$4,417 for the farm origin group. The mineral group also pays the highest wages. In 1945 the average salary and wage was \$1,914 for the mineral group and \$1,407 for the farm origin group.

12.—Principal Statistics of the Manufacturing Industries of Canada, Classified According to the Origin of the Material Used, by Main Groups, Significant Years 1929-45.

Subsection 5.—Leading Manufacturing Industries

In the following statement, the rank of the ten leading industries in 1945, from the standpoint of gross value of production, is compared with their respective ranks in significant years since 1922.

THE TEN LEADING INDUSTRIES, 1945, COMPARED AS TO RANK, SIGNIFICANT YEARS 1922-45

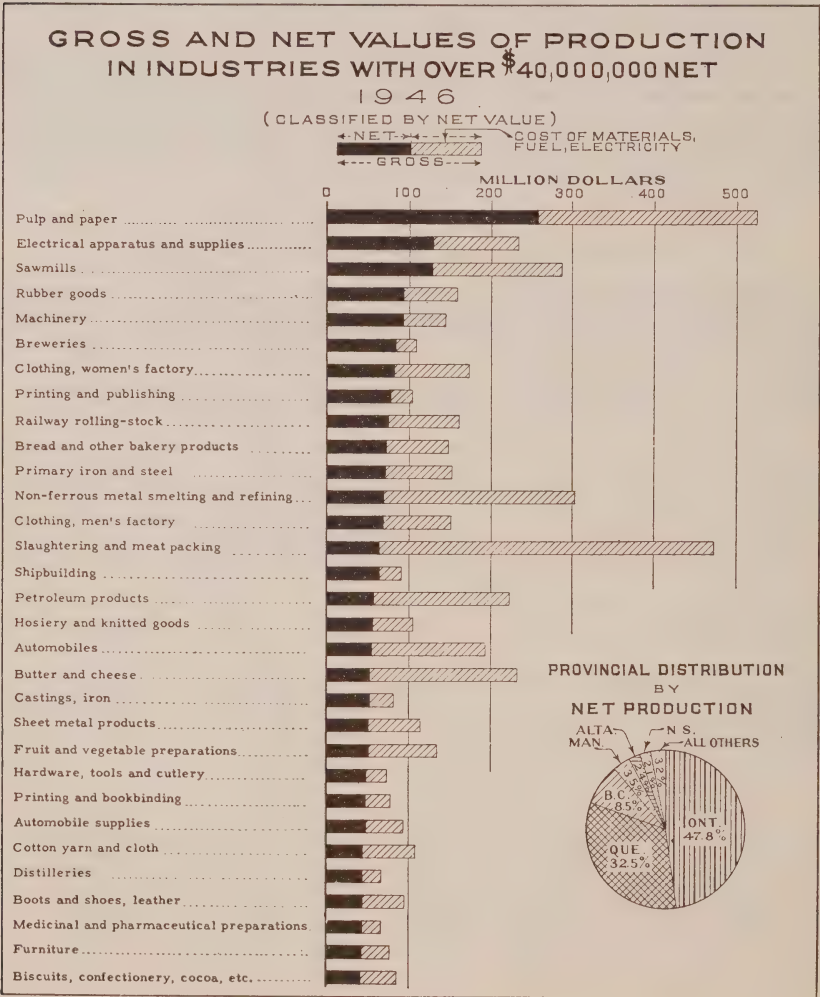

NOTE.—Where a dash is given it indicates that the industry did not rank among the forty leading industries.

Industry	Rank in							
	1945	1944	1943	1939	1937	1933	1929	1922
Slaughtering and meat packing.....	1	1	3	3	3	3	2	3
Pulp and paper.....	2	5	7	2	2	1	1	2
Non-ferrous metal smelting and refining.....	3	2	1	1	1	2	9	—

Butter and cheese.....	9	10	11	4	6	.5	6	5
Shipbuilding.....	10	6	4	—	—	—	—	—

A prominent feature of Canadian manufacturing development in recent years has been the rapid growth of non-ferrous metal smelting. This industry, based upon the rich base metal resources of the country, has now taken its place among the leading manufactures along with the industries based upon forest, agricultural and live-stock resources. The incidence of the depression resulted in a rearrangement in the ranking of many industries; in some cases this has proved to be temporary. Under the impetus of war production, the industries engaged in producing the

equipment needed by the Armed Forces, such as shipbuilding, aircraft, automobiles, miscellaneous chemical products, and primary iron and steel, advanced to higher positions. With the decline in the production of war equipment during 1945, the food industries, by reason of the continuing demand for their products bettered

The solid portions of the bars according to which the industries below are arranged show the values added by them, respectively, to the raw materials they purchase to work on. This value, actually added by the industry, is the criterion by which its importance can best be measured. To take a few examples, i.e., judging on gross value of production (shaded plus solid portion), slaughtering and meat packing, non-ferrous metal smelting and refining, or the automobile manufacturing industry would rank higher than many industries whose individual contributions to the manufacturing process are substantially greater.

their position. Slaughtering and meat packing maintained its premier position while flour and feed mills advanced from twelfth to eighth place and butter and cheese from tenth to ninth place. Shipbuilding dropped from sixth to tenth place and non-ferrous metal smelting and refining from second to third place.

13.—Principal Statistics of the Forty Leading Industries of Canada, Ranked According to Gross Value of Products, 1945

Industry	Estab-lish-ments	Em-ployees	Salaries and Wages	Cost of Materials	Value of Products
